EXPLANATION

SAND AND GRAVEL, QUARTZOSITY OF FLUVIAL ORIGINS—gravelly sand and gravel at or near land surface are deposited by glacial streams at outwash or co-current deposits.

SAND AND GRAVEL, QUARTZOSITY OF RETICULAR ORIGINS—gravelly sand and gravel of glacial origin, buried beneath fine grained materials such as clay, silt, and fine-grained sand.

SAND AND GRAVEL, QUARTZOSITY OF RETICULAR ORIGINS AND ALLUVIAL—sand in deep, narrow channels that the fine grained materials are overlain by 1 to 20 feet of sand and gravel. These surficial rocks of sand and gravel are associated with the deposits of the eroded surface deposits, often deposited in the principal alluvium.

SAND AND GRAVEL, QUARTZOSITY OF RETICULAR ORIGINS AND ALLUVIAL—sand in deep, narrow channels that the fine grained materials are overlain by 1 to 20 feet of sand and gravel. These surficial rocks of sand and gravel are associated with the deposits of the eroded surface deposits, often deposited in the principal alluvium.

SAND AND GRAVEL, QUARTZOSITY OF RETICULAR ORIGINS AND ALLUVIAL—sand in deep, narrow channels that the fine grained materials are overlain by 1 to 20 feet of sand and gravel. These surficial rocks of sand and gravel are associated with the deposits of the eroded surface deposits, often deposited in the principal alluvium.
