POTENTIAL YIELDS OF WELLS IN UNCONSOLIDATED AQUIFERS IN UPSTATE NEW YORK—NIAGARA SHEET

By Todd G. Sader

These maps show the potential yields of the unconsolidated aquifers in the Niagara region. The yields are based on the available data on the hydrogeological characteristics of the area. The maps provide a comprehensive view of the potential water sources in the region, which is crucial for planning and management of water resources.

The potential yields are expressed as gallons per minute and can be used to determine the feasibility of drilling for water in a particular location. The maps also highlight areas with high and low yields, which can help in identifying potential sites for water extraction.

The data used in these maps are from various sources, including geological surveys, hydrological studies, and field observations. The maps are designed to be a valuable tool for administrators, planners, and engineers involved in water resource management in the Niagara region.

REFERENCES CITED

These maps are intended to be a useful tool for water resource management in the Niagara region. They provide information on the potential yields of unconsolidated aquifers, which can help in planning and development of water resources in the area.
