

Figure A2. (A) Digital borehole image, (B) slabbed core photograph, (C) thin-section photomicrograph, and (D) whole-core porosity and permeability data for the coral framestone rock-fabric facies of HFC4 for the G-3692 test corehole. Slabbed core sample (B) is from a depth of approximately 10.7 to 11.25 feet below land surface. The thin section photomicrograph (C) is from a depth of 10.8 feet below land surface.
