

# Quality of Surface Waters of the United States 1957

## Parts 1-4. North Atlantic Slope Basins to St. Lawrence River Basin

*Prepared under the direction of S. K. LOVE, Chief, Quality of Water Branch*

---

GEOLOGICAL SURVEY WATER-SUPPLY PAPER 1520

*Prepared in cooperation with the States  
of Alabama, Connecticut, Delaware,  
Florida, Georgia, Illinois, Indiana,  
Kentucky, Minnesota, New Jersey, New  
York, North Carolina, Ohio, Pennsyl-  
vania, South Carolina, West Virginia,  
and with other agencies*

**FRED A. SEATON, *Secretary***

**GEOLOGICAL SURVEY**

**Thomas B. Nolan, *Director***

## PREFACE

This report was prepared by the Geological Survey in cooperation with the States of Alabama, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Kentucky, Minnesota, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, and West Virginia, and with other agencies by personnel of the Water Resources Division under the direction of L. B. Leopold, chief hydraulic engineer, and S. K. Love, chief, Quality of Water Branch. The data were collected and computed under the supervision of the following engineers or district chemists:

|                                                  |                   |
|--------------------------------------------------|-------------------|

| P. C. Benedict, succeeded by D. M. Culbertson. . | Lincoln, Nebr.    |
| G. A. Billingsley.....                           | Raleigh, N. C.    |
| J. W. Geurin.....                                | Ocala, Fla.       |
| F. H. Pauszek .....                              | Albany, N. Y.     |
| G. W. Whetstone .....                            | Columbus, Ohio    |

# CONTENTS

|                                              | Page |
|----------------------------------------------|------|
| Introduction .....                           | 1    |
| Collection and examination of samples.....   | 3    |
| Chemical quality.....                        | 3    |
| Temperature .....                            | 4    |
| Sediment .....                               | 4    |
| Expression of results .....                  | 6    |
| Composition of surface waters .....          | 8    |
| Mineral constituents in solution.....        | 9    |
| Silica .....                                 | 9    |
| Aluminum .....                               | 9    |
| Manganese .....                              | 9    |
| Iron .....                                   | 10   |
| Calcium.....                                 | 10   |
| Magnesium .....                              | 10   |
| Sodium and potassium.....                    | 10   |
| Carbonate and bicarbonate.....               | 11   |
| Sulfate .....                                | 11   |
| Chloride.....                                | 11   |
| Fluoride.....                                | 11   |
| Nitrate.....                                 | 12   |
| Boron .....                                  | 12   |
| Dissolved solids .....                       | 13   |
| Properties and characteristics of water..... | 13   |
| Temperature.....                             | 13   |
| Oxygen consumed .....                        | 13   |
| Color .....                                  | 13   |
| Hydrogen-ion-concentration .....             | 14   |
| Specific conductance .....                   | 14   |
| Hardness.....                                | 14   |
| Acidity.....                                 | 15   |
| Corrosiveness .....                          | 15   |
| Percent sodium .....                         | 15   |
| Sodium-adsorption-ratio .....                | 16   |
| Sediment .....                               | 16   |

# QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1957

---

## PARTS 1-4

---

### INTRODUCTION

The quality-of-water investigations of the United States Geological Survey are concerned with chemical and physical characteristics of the surface and ground water supplies of the Nation. Most of the investigations carried on in cooperation with States and other Federal agencies deal with the amounts of matter in solution and in suspension in streams.

The records of chemical analysis, suspended sediment, and temperature for surface waters given in this volume serve as a basis for determining the suitability of the waters examined for industrial, agricultural, and domestic uses insofar as such use is affected by the dissolved or suspended mineral matter in the waters. The discharge of a stream and, to a lesser extent, the chemical quality are related to variations in rainfall and other forms of precipitation. In general, lower concentrations of dissolved solids may be expected during the periods of high flow than during periods of low flow. The concentration in some streams may change materially with relatively small variations in flow, whereas for other streams the quality may remain relatively uniform throughout large ranges in discharge. The quantities of suspended sediment carried by streams are also related to discharge, and during flood periods the sediment concentrations in many streams vary over wide ranges.

Publication of annual records of chemical analyses, suspended sediment, and water temperature was begun by the Geological Survey in 1941. The records prior to 1948 were published each year in a single volume for the entire country. Beginning in 1948, the records were published in two volumes, and beginning in 1950, in four volumes, covering the drainage basins shown in Figure 1. The samples for which data are given in this volume were collected from October 1, 1956, to September 30, 1957. The records are arranged by drainage basins according to Geological Survey practice in reporting records of streamflow: Stations on tributary

Figure 1.--Map of the United States showing basins covered by the four water-supply papers on quality of surface waters in 1957. The shaded portion represents the section of the country covered by this volume; the unshaded portion represents the section of the country covered by other water-supply papers.

streams are listed between stations on the main stem in the order in which those tributaries enter the main stem. Descriptive statements are given for each sampling station for which regular series of chemical analyses, temperature observations, or sediment determinations have been made. These statements include the location of the stream-sampling station, drainage area, length of time for which records are available, extremes of mineralization, hardness, water temperature, sediment loads, and other pertinent data. Records of water discharge of the streams at or near the sampling period are included in most tables of analyses.

During the year ending September 30, 1957, 266 regular sampling stations on 194 streams for the study of the chemical character of surface waters were maintained by the Geological Survey in the area covered by this volume. Samples were collected less frequently during the year at many other points. Water temperatures were measured daily at 179 stations. Not all analyses of samples of surface water collected during the year have been included. Single analyses of an incomplete nature generally have been omitted. Also, analyses made of the daily samples before compositing have not been reported. The specific conductance of almost all daily samples was determined, and as noted in the table head-

ings this information is available for reference at the district offices listed under Division of Work, on page

Quantities of suspended sediment are reported for 41 stations during the year ending September 30, 1957. The sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Sediment samples were collected less frequently during the year at many other points. In connection with measurements of sediment discharge, sizes of sediment particles were determined at 34 of the stations.

Material which is transported almost in continuous contact with the stream bed and the material that bounces along the bed in short skips or leaps is termed "bedload" and is not considered in this report. All other undissolved fragmental material in transport is termed "suspended sediment" and generally constitutes the major part of the total sediment load. At the present time no reliable routine method has been developed for determining bedload.

## COLLECTION AND EXAMINATION OF SAMPLES

### CHEMICAL QUALITY

Samples for chemical analyses were usually collected at or near points on streams where gaging stations are maintained for measurement of water discharge. Two methods of compositing water samples for analysis are used by the Geological Survey: (1) Equal volume method—Three composite samples were usually prepared each month by mixing together equal volumes of daily samples collected from the 1st to the 10th, from the 11th to the 20th, and from the 21st to the end of the month. Composite samples were prepared for shorter periods if the specific conductance of the daily samples indicated that the mineral content of the water had changed significantly. Conversely, composite samples were occasionally prepared for longer periods if the specific conductance of the daily samples indicated that the mineral content had remained nearly uniform. (2) Discharge method—Composite samples were prepared by mixing together a volume from each sample in proportion to the product of the rate of water discharge at the time of sampling and the time interval represented by that sample. Generally, each daily sample is assumed to represent an equal time interval; therefore, the volume from each sample is proportional only to the water discharge at the time of sampling. Compositing samples by the discharge method was limited to some streams west of the Mississippi River.

The samples were analyzed according to methods regularly used by the Geological Survey. These methods are essentially the same as, or are modifications of, methods described in recognized authoritative publications for the mineral analysis of water samples (Collins, 1928; Am. Public Health Assoc., 1955).

## TEMPERATURE

Daily water temperatures were measured at most of the stations when chemical quality or sediment samples were collected. So far as practicable, the water temperatures were taken at about the same time each day for an individual station in order that the data would be relatively unaffected by diurnal variations in temperature. Most large, swiftly flowing streams probably have a small diurnal variation in water temperature, whereas sluggish or shallow streams may have a daily range of several degrees and may follow closely the changes in air temperature. The thermometers used for determining water temperature were accurate to plus or minus  $0.5^{\circ}\text{F}$ .

At stations where thermographs are located, the records consist of maximum and minimum temperatures for each day, and the monthly averages of maximum daily and minimum daily temperatures.

## SEDIMENT

In general, suspended-sediment samples were collected daily with U. S. depth-integrating cable-suspended samplers (U. S. Interagency, 1948, p. 70-76 and U. S. Interagency, 1952, p. 86-90) from a fixed sampling point at one vertical in the cross section. The US DH-48 hand sampler was used at many stations during periods of low flow. Depth-integrated samples were collected periodically at three or more verticals in the cross section to determine the cross-sectional distribution of the concentration of suspended sediment with respect to that at the daily sampling vertical. In streams where transverse distribution of sediment concentration ranges widely, samples were taken regularly at two or more verticals to determine the average concentration across the section. During periods of high flow, samples were taken two or more times throughout the day at many sampling stations, and during periods of rapidly changing flow samples were taken hourly at some stations.

Sediment concentrations were determined by filtration or evaporation of the samples as required. At many stations the daily mean concentration for some days was obtained by plotting the instantaneous concentrations on the original or copies of the original gage-height chart. The plotted concentrations, adjusted if necessary for cross-sectional distribution with respect to that at the daily sampling vertical, were connected or averaged by continuous curves

to obtain a concentration graph. This graph represented the estimated concentration at any time and, for most periods, daily mean concentrations were determined from the graph. When the concentration and water discharge were changing rapidly, the day was often subdivided for this computation. For some periods when the day-to-day variation in the concentration was negligible, the data were not plotted, and the average concentration of the samples was used as the mean concentration for the day. For certain stations, when the discharge and concentrations were relatively low and varied only slightly from day to day, the samples for a number of days were composited and the mean daily concentrations and mean daily loads are shown.

For some periods when no samples were collected, daily loads of suspended sediment were estimated on the basis of water discharge, sediment concentrations observed immediately preceding and following the periods, and suspended-sediment loads for other periods of similar discharge. The estimates were further guided by weather conditions and sediment discharge for other stations.

In many instances where there were no observations for several days, the suspended-sediment loads for individual days are not estimated, because numerous factors influencing the quantities of transported sediment made it very difficult to make accurate estimates for individual days. However, estimated loads of suspended sediment for missing days in otherwise continuous period of sampling have been included in monthly and annual totals for most streams to provide a complete record. For some streams, samples were collected about weekly, monthly, or less frequently, and only rates of sediment discharge at the time of sampling are shown.

In addition to the records of quantities of suspended sediment transported, records of the particle sizes of sediment are included. The particle sizes of the suspended sediments for many of the stations, and the particle sizes of the bed material for some of the stations were determined periodically. As much of the material carried in suspension is finer than 0.062 mm, the pipet method (Kilmer and Alexander, 1949) or the bottom withdrawal tube method (U. S. Interagency, 1943, p. 82-90) were used in most of the analyses. For most samples, material between 1.0 mm and 0.062 mm was analyzed by the visual accumulation tube method (U. S. Interagency 1957). Separation of sand from the silt-clay-colloid fraction was by sieve. For some samples all sediment coarser than 0.062 mm was analyzed by the sieve method. For material finer than 0.062 mm the settling medium used was native water or distilled water to which a dispersing agent had been added. Because sedimentation diameters of the clay and colloidal fractions are often affected by the chemical character of the settling medium, analyses made with native water may more nearly simulate particle sizes existing in the stream. Results of analyses with dis-

tilled water containing a dispersing agent approximate ultimate particle sizes of the finer fractions. The concentration of sediment suspension for analysis was reduced to less than 5,000 parts per million where necessary by means of a sample splitter, in order to stay within limits recommended for the bottom-withdrawal tube or pipet method; therefore, the concentration of sediment for analyses was often different from the concentration in the stream. The concentration at which analyses were made is indicated in the appropriate tables.

## EXPRESSION OF RESULTS

The dissolved mineral constituents are reported in parts per million. A part per million is a unit weight of a constituent in a million unit weights of water. Equivalents per million are not given in this report although the expression of analyses in equivalents per million is sometimes preferred. An equivalent per million is a unit chemical combining weight of a constituent in a million unit weights of water. Equivalents per million are calculated by dividing the concentration in parts per million by the chemical combining weights of the individual constituents. For convenience in making this conversion the reciprocals of chemical combining weights of the most commonly reported constituents (ions) are given in the following table:

| Constituent                        | Factor | Constituent                          | Factor |
|------------------------------------|--------|--------------------------------------|--------|
| Iron ( $\text{Fe}^{++}$ ).....     | 0.0358 | Carbonate ( $\text{CO}_3^{--}$ ) ..  | 0.0333 |
| Iron ( $\text{Fe}^{+++}$ ).....    | .0537  | Bicarbonate ( $\text{HCO}_3^-$ ) .   | .0164  |
| Calcium ( $\text{Ca}^{++}$ ).....  | .0499  | Sulfate ( $\text{SO}_4^{--}$ ) ..... | .0208  |
| Magnesium ( $\text{Mg}^{++}$ ) ... | .0822  | Chloride ( $\text{Cl}^-$ ).....      | .0282  |
| Sodium ( $\text{Na}^+$ ) .....     | .0435  | Fluoride ( $\text{F}^-$ ) .....      | .0526  |
| Potassium ( $\text{K}^+$ ) .....   | .0256  | Nitrate ( $\text{NO}_3^-$ ) .....    | .0161  |

Results given in parts per million can be converted to grains per United States gallon by dividing by 17.12. A calculated quantity of sodium and potassium is given in some analyses and is the quantity of sodium needed in addition to the calcium and magnesium to balance the acid constituents.

The hardness, expressed in terms of an equivalent quantity of calcium carbonate ( $\text{CaCO}_3$ ), is calculated from the equivalents of calcium and magnesium, or is determined by direct titration. The hardness caused by calcium and magnesium (and other ions if significant) equivalent to the carbonate and bicarbonate is called carbonate hardness; the hardness in excess of this quantity is called noncarbonate hardness.

The value usually reported as dissolved solids is the residue

on evaporation after drying at 180°C for 1 hour. For some waters, particularly those containing moderately large quantities of soluble salts, the value reported is calculated from the quantities of the various determined constituents using the carbonate equivalent of the reported bicarbonate. The calculated sum of the constituents may be given instead of or in addition to the residue. In the analyses of most waters used for irrigation, the quantity of dissolved solids is given in tons per acre-foot as well as in parts per million.

Percent sodium is computed for those analyses where sodium and potassium are reported separately by dividing the equivalents per million of sodium by the sum of the equivalents per million of calcium, magnesium, sodium, and potassium and multiplying the quotient by 100. In analyses where sodium and potassium were calculated and reported as a combined value, the value reported for percent sodium will include the equivalent quantity of potassium. In most waters of moderate to high concentration the proportion of potassium is much smaller than that of sodium.

Specific conductance is given for most analyses and was determined by means of a conductance bridge and using a standard potassium chloride solution as reference. Specific conductance values are expressed in micromhos per centimeter at 25°C. Specific conductance in micromhos is 1 million times the reciprocal of specific resistance at 25°C. Specific resistance is the resistance in ohms of a column of water 1 centimeter long and 1 square centimeter in cross section. The discharge of the streams is reported in cubic feet per second (see Streamflow, p. 17) and the temperature in degrees Fahrenheit. Color is expressed in units of the platinum-cobalt scale proposed by Hazen (1892, p. 427-428). Hydrogen-ion concentration is expressed in terms of pH units. By definition the pH value of a solution is the negative logarithm of the concentration of gram ions of hydrogen. However, the pH meter that is generally used in Survey laboratories determines the activity of the hydrogen ions as distinguished from concentration.

An average of analyses for the water year is given for most daily sampling stations. Most of these averages are arithmetical or time-weighted; when analyses during a year are all on 10-day composites of daily samples with no missing days, the arithmetical and time-weighted averages are equivalent. A time-weighted average represents the composition of water that would be contained in a vessel or reservoir that had received equal quantities of water from the river each day for the water year. A discharge-weighted average approximates the composition of water that would be found in a reservoir containing all of the water passing a given station during the year after thorough mixing in the reservoir. A discharge-weighted average is computed by multiplying the discharge for the sampling period by the concentrations of the individual constituents for the corresponding period and dividing the sum of the products

by the sum of the discharges. Discharge-weighted averages are usually lower than arithmetical averages for most streams because at times of high discharge the rivers generally have lower concentrations of dissolved solids.

The concentration of sediment in parts per million is computed as 1,000,000 times the ratio of the weight of sediment to the weight of water-sediment mixture. Daily sediment loads are expressed in tons per day and except for subdivided days are usually obtained by multiplying daily mean sediment concentration in parts per million by the daily mean discharge, and the appropriate conversion factor, normally 0.0027.

Particle-size analyses are expressed in percentages of material finer than indicated sizes in millimeters. The size classification used in this report is that recommended by the American Geophysical Union subcommittee on Terminology (Lane and others, 1947, p. 937). Other data included as pertinent to the size analyses for many streams are the date of collection, the stream discharge and sediment concentration when sample was collected, the concentration of the suspension during analysis, and the method of analysis.

## COMPOSITION OF SURFACE WATERS

All natural waters contain dissolved mineral matter. Water in contact with soils or rock, even for only a few hours, will dissolve some rock materials. The quantity of dissolved mineral matter in a natural water depends primarily on the type of rocks or soils with which the water has been in contact and the length of time of contact. Some streams are fed by both surface runoff and ground water from springs or seeps. Such streams reflect the chemical character of their concentrated underground sources during dry periods and are more dilute during periods of heavy rainfall. Ground water is generally more highly mineralized than surface runoff because it remains in contact with the rocks and soils for much longer periods. The concentration of dissolved solids in a river water is frequently increased by drainage from mines or oil fields, by the addition of industrial or municipal wastes, or--in irrigated regions--by drainage from irrigated lands.

The mineral constituents and physical properties of natural waters reported in the tables of analyses include those that have a practical bearing on the value of the waters for most purposes. The analyses generally include results for silica, iron, calcium, magnesium, sodium, potassium (or sodium and potassium together as sodium), bicarbonate, sulfate, chloride, fluoride, nitrate, boron, pH, and dissolved solids. Aluminum, manganese, color, acidity, oxygen consumed, and other dissolved constituents and physical properties are reported for certain streams. Phenolic

material and minor elements including strontium, chromium, nickel, copper, lead, zinc, cobalt, arsenic, cadmium, and others are occasionally determined for a few streams in connection with specific problems in local areas and the results are reported when appropriate. The source and significance of the different constituents and properties of natural waters are discussed in the following paragraphs.

## MINERAL CONSTITUENTS IN SOLUTION

### Silica ( $\text{SiO}_2$ )

Silica is dissolved from practically all rocks. Some natural surface waters contain less than 5 parts per million of silica and a few contain more than 50 parts, but most waters contain from 1 to 30 parts per million. Silica affects the usefulness of a water because it contributes to the formation of boiler scale; it usually is removed from feed water for high-pressure boilers. Silica also forms troublesome deposits on the blades of stream turbines.

### Aluminum (Al)

Aluminum is generally present only in negligible quantities in natural waters except in areas where the waters have been in contact with the more soluble rocks of high aluminum content such as bauxite and certain shales. Acid waters often contain large amounts of aluminum. It may be troublesome in feed waters where it tends to be deposited as a scale on boiler tubes.

### Manganese (Mn)

Manganese is dissolved in appreciable quantities from rocks in some sections of the country. Waters impounded in large reservoirs may contain manganese that has been dissolved from the mud on the bottom of the reservoir by action of carbon dioxide produced by anaerobic fermentation of organic matter. Manganese is not regularly determined in areas where it is not present in the waters in appreciable amounts. It is especially objectionable in water used in laundry work and in textile processing. Concentrations as low as 0.2 part per million may cause a dark-brown or black stain on fabrics and porcelain fixtures. Appreciable quantities of manganese are often found in waters containing objectionable quantities of iron.

### Iron (Fe)

Iron is dissolved from many rocks and soils. On exposure to the air, normal basic waters that contain more than 1 part per million of iron soon become turbid with the insoluble reddish ferric oxide produced by oxidation. Surface waters, therefore, seldom contain as much as 1 part per million of dissolved iron, although some acid waters carry large quantities of iron in solution. Iron causes reddish-brown stains on white porcelain or enameled ware and fixtures and on fabrics washed in the water.

### Calcium (Ca)

Calcium is dissolved from almost all rocks and soils, but the highest concentrations are usually found in waters that have been in contact with limestone, dolomite, and gypsum. Calcium and magnesium make water hard and are largely responsible for the formation of boiler scale. Most waters associated with granite or silicious sands contain less than 10 parts per million of calcium; waters in areas where rocks are composed of dolomite and limestone contain from 30 to 100 parts per million; and waters that have come in contact with deposits of gypsum may contain several hundred parts per million.

### Magnesium (Mg)

Magnesium is dissolved from many rocks, particularly from dolomitic rocks. Its effect in water is similar to that of calcium. The magnesium in soft waters may amount to only 1 or 2 parts per million, but water in areas that contain large quantities of dolomite or other magnesium-bearing rocks may contain from 20 to 100 parts per million or more of magnesium.

### Sodium and potassium (Na and K)

Sodium and potassium are dissolved from almost all rocks. Sodium is the predominant cation in some of the more highly mineralized waters found in the Western United States. Natural waters that contain only 3 or 4 parts per million of the two together are likely to carry almost as much potassium as sodium. As the total quantity of these constituents increases, the proportion of sodium becomes much greater. Moderate quantities of sodium and potassium have little effect on the usefulness of the water for most purposes, but waters that carry more than 50 or 100 parts per million of the two may require careful operation of steam boilers

to prevent foaming. More highly mineralized waters that contain a large proportion of sodium salts may be unsatisfactory for irrigation.

### Carbonate and bicarbonate ( $\text{CO}_3$ and $\text{HCO}_3$ )

Bicarbonate occurs in waters largely through the action of carbon dioxide, which enables the water to dissolve carbonates of calcium and magnesium. Carbonate as such is not usually present in appreciable quantities in natural waters. The bicarbonate in waters that come from relatively insoluble rocks may amount to less than 50 parts per million; many waters from limestone contain from 200 to 400 parts per million. Bicarbonate in moderate concentrations in water has no effect on its value for most uses. Bicarbonate or carbonate is an aid in coagulation for the removal of suspended matter from water.

### Sulfate ( $\text{SO}_4$ )

Sulfate is dissolved from many rocks and soils but in especially large quantities from gypsum and from beds of shale. It is formed also by the oxidation of sulfides of iron and is therefore present in considerable quantities in waters from mines. Sulfate in waters that contain much calcium and magnesium causes the formation of hard scale in steam boilers and may increase the cost of softening the water.

### Chloride (Cl)

Chloride is dissolved from rock materials in all parts of the country. Surface waters in the humid regions are usually low in chloride content, whereas streams in arid or semiarid regions may contain several hundred parts per million of chloride leached from soils and rocks, especially where the streams receive return drainage from irrigated lands or are affected by ground-water inflow carrying appreciable quantities of chloride. Large quantities of chloride may affect the industrial use of water by increasing the corrosiveness of waters that contain large quantities of calcium and magnesium.

### Fluoride (F)

Fluoride has been reported as being present in some rocks in about the same amount as chloride. However, the quantity of

fluoride in natural surface waters is ordinarily very small compared to that of chloride. Recent investigations indicate that the incidence of dental caries is less when there are small amounts of fluoride present in the water supply than when there is none. However, excess fluoride in water is associated with the dental defect known as mottled enamel if the water is used for drinking by young children during calcification or formation of the teeth (Dean, 1936, p. 1269-1272). This defect becomes increasingly noticeable as the quantity of fluoride in water increases above 1.5 to 2.0 parts per million.

### Nitrate ( $\text{NO}_3$ )

Nitrate in water is considered a final oxidation product of nitrogenous material and may indicate contamination by sewage or other organic matter. The quantities of nitrate present in surface waters are generally less than 5 parts per million (as  $\text{NO}_3$ ) and have no effect on the value of the water for ordinary uses.

It has been reported that as much as 2 parts per million of nitrate in boiler water tends to decrease intercrystalline cracking of boiler steel. Studies made in Illinois indicate that nitrates in excess of 70 parts per million (as  $\text{NO}_3$ ) may contribute to methemoglobinemia ("blue babies") (Faucett and Miller, 1946, p. 593), and more recent investigations conducted in Ohio show that drinking water containing nitrates in the range of 44 to 88 parts per million or more (as  $\text{NO}_3$ ) may cause methemoglobinemia (Waring, 1949). In a report published by the National Research Council, Maxcy (1950, p. 271) concludes that a nitrate content in excess of 44 parts per million (as  $\text{NO}_3$ ) should be regarded as unsafe for infant feeding.

### Boron (B)

Boron in small quantities has been found essential for plant growth, but irrigation water containing more than 1 part per million of boron is detrimental to citrus and other boron-sensitive crops. Boron is reported in Survey analyses of surface waters in arid and semiarid regions where irrigation is practiced or contemplated, but few of the surface waters analyzed have harmful concentrations of boron.

### Dissolved solids

The reported quantity of dissolved solids--the residue on evaporation--consists mainly of the dissolved mineral constituents in the water. It may also contain some organic matter and water of crystallization. Waters with less than 500 parts per million of dissolved solids are usually satisfactory for domestic and some industrial uses. Water containing several thousand parts per million of dissolved solids are sometimes successfully used for irrigation where practices permit the removal of soluble salts through the application of large volumes of water on well-drained lands, but generally water containing more than about 2,000 ppm is considered to be unsuitable for long-term irrigation under average conditions.

## PROPERTIES AND CHARACTERISTICS OF WATER

### Temperature

Large quantities of water are used in industrial operation; therefore temperature and seasonal fluctuations of that temperature are major considerations in planning the use of water for cooling in industrial plants. Water at high temperature can carry less oxygen in solution than at low temperature. Consequently water temperature can affect or determine the pollution characteristics of a stream. Temperature data are required in studies of water intended for aquatic life. A few degrees rise in temperature may seriously limit the capacity of a stream to support fish life.

### Oxygen consumed

The amount of oxygen consumed furnishes an approximation of the oxidizable matter in the unfiltered and filtered samples and gives a partial measure of polluting materials such as sewage and oxidizable industrial wastes. Waters of naturally high color may have relatively high values for oxygen consumed, and waters that are not noticeably colored may contain oxidizable material.

### Color

In water analysis the term "color" refers to the appearance of water that is free from suspended solids. Many turbid waters

that appear yellow, red, or brown when viewed in the stream show very little color after the suspended matter has been removed. The yellow-to-brown color of some waters is usually caused by organic matter extracted from leaves, roots, and other organic substances in the ground. In some areas objectionable color in water results from industrial wastes and sewage. Clear deep water may appear blue as the result of a scattering of sunlight by the water molecules. Water for domestic use and some industrial uses should be free from any perceptible color. A color less than 10 units generally passes unnoticed. Some swamp waters have natural color of 200 to 300 units or more.

### Hydrogen-ion concentration (pH)

The degree of acidity or alkalinity of water, as indicated by the hydrogen-ion concentration, expressed as pH (see p.7 ), is related to the corrosive properties of water and is useful in determining the proper treatment for coagulation that may be necessary at water-treatment plants. A pH of 7.0 indicates that the water is neither acid nor alkaline. pH readings progressively lower than 7.0 denote increasing acidity and those progressively higher than 7.0 denote increasing alkalinity. The pH of most natural surface waters ranges between 6 and 8. Some alkaline surface waters have pH values greater than 8.0, and waters containing free mineral acid usually have pH values less than 4.5.

### Specific conductance (micromhos per centimeter at 25°C)

The specific conductance of a water is a measure of its capacity to conduct a current of electricity (see p.7 ). The conductance varies with the concentration and degree of ionization of the different minerals in solution and with the temperature of the water. When considered in conjunction with results of determinations for other constituents, specific conductance is a useful determination and plays an important part in indicating changes in concentration of the total quantity of dissolved minerals in surface waters.

### Hardness

Hardness is the characteristic of water that receives the most attention in industrial and domestic use. It is commonly recognized by the increased quantity of soap required to produce lather. The use of hard water is also objectionable because it contributes to the formation of scale in boilers, water heaters, radiators, and

pipes, with the resultant decrease in rate of heat transfer, possibility of boiler failure, and loss of flow.

Hardness is caused almost entirely by compounds of calcium and magnesium. Other constituents--such as iron, manganese, aluminum, barium, strontium, and free acid--also cause hardness, although they usually are not present in quantities large enough to have any appreciable effect. Water that has less than 60 parts per million of hardness is usually rated as soft and suitable for many purposes without further softening. Waters with hardness ranging from 61 to 120 parts per million may be considered moderately hard, but this degree of hardness does not seriously interfere with the use of water for many purposes except for use in high-pressure steam boilers and in some industrial processes. Waters with hardness ranging from 121 to 200 parts per million are considered hard, and laundries and industries may profitably soften such supplies. Water with hardness above 200 parts per million generally requires some softening before being used for most purposes.

### Acidity

The acidity of a natural water represents the content of free carbon dioxide and other uncombined gases, organic acids, mineral acids and salts of strong acids and weak bases that hydrolyze to give hydrogen ions. Sulfates of iron and aluminum in mine and industrial wastes are common sources of acidity.

### Corrosiveness

The corrosiveness of a water is that property which makes the water aggressive to metal surfaces and frequently results in the appearance of the "red-water" caused by solution of iron. The disadvantages of iron in water have been discussed previously. Additionally, corrosion causes the deterioration of water pipes, steam boilers, and water-heating equipment. Many waters that do not appreciably corrode cold-water lines will aggressively attack hot-water lines. Oxygen, carbon dioxide, free acid, and acid-generating salts are the principal constituents in water that cause corrosion. In a general way, very soft waters of low mineral content tend to be more corrosive than hard waters containing appreciable quantities of carbonates and bicarbonates of calcium and magnesium.

### Percent sodium

The proportion of sodium to the total cation concentration is termed "percent sodium", and is reported in most of the analyses

of waters collected from streams in the western part of the country where irrigation is practiced extensively. The proportion of sodium to all the constituents in the water is explained on page 10 under "Sodium and potassium". Waters in which the percent sodium is more than 60 may be injurious when applied to certain types of soils, particularly when adequate drainage is not provided (Magistad and Christiansen, 1944, p. 8-9).

### Sodium-adsorption-ratio

Of more significance than percent sodium for use as an index of the sodium or alkali hazard to the soil is the sodium-adsorption-ratio because it relates more directly to the adsorption of sodium by the soil. The term, "sodium-adsorption-ratio (SAR)" was introduced by the U. S. Salinity Laboratory Staff (1954), and is a ratio expressing the relative activity of sodium ions in exchange reactions with the soil. It is expressed by the equation:

$$SAR = \frac{Na^{+}}{\sqrt{\frac{Ca^{++} + Mg^{++}}{2}}}$$

where the concentrations of the ions are expressed in milliequivalents per liter (or equivalents per million for most irrigation waters).

Waters are divided into four classes with respect to sodium or alkali hazard: low, medium, high, and very high, depending upon the SAR and the specific conductance. At a conductance of 100 micromhos per centimeter the dividing points are at SAR values of 10, 18, and 26, but at 5,000 micromhos the corresponding dividing points are SAR values of approximately 2.5, 6.5, and 11. Waters range in respect to sodium hazard from those which can be used for irrigation on almost all soils to those which are generally unsatisfactory for irrigation.

### SEDIMENT

Fluvial sediment is generally regarded as that sediment which is transported by, suspended in, or deposited by water. Suspended sediment is that part of it which remains in suspension in water owing to the upward components of turbulent currents or by colloidal suspension. Most fluvial sediment results from the normal process of erosion, which in turn is part of the geologic cycle of

rock transformation. In some instances, this normal process may have been accelerated by agricultural practices. Sediment also results from a number of industrial activities. In certain sections, waste materials from mining, logging, oil-field, and other industrial operations introduce large quantities of suspended as well as dissolved material.

The quantity of sediment, transported or available for transportation, is affected by climatic conditions, form or nature of precipitation, plant cover, topography, and land use. An important property of fluvial sediment is the fall velocity of the particles in transport. Particle sizes, as determined by various methods, represent mechanical diameters, which are related to sedimentation diameters indirectly. Sediment particles in the sand-size (larger than 0.062 mm) range do not appear to be affected by flocculation or dispersion resulting from the mineral constituents in solution. The sedimentation diameter of clay and silt particles in suspension may vary considerably from point to point in a stream or reservoir, depending on the mineral matter in solution and in suspension and the degree of turbulence present. The size of sediment particles in transport at any point depends on the type of erodible and soluble material in the drainage area, the degree of flocculation present, time in transport, and characteristics of the transporting flow. The flow characteristics include velocity of water, turbulence, and the depth, width, and roughness of the channel. As a result of these variable characteristics, the size of particles transported, as well as the total sediment load, is in constant adjustment with the characteristics and physical features of the stream and drainage area.

## STREAMFLOW

Most of the records of stream discharge, used in conjunction with the chemical analyses and in the computation of sediment loads in this volume, are published in Geological Survey reports on the surface-water supply of the United States. The discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges for the time at which samples were collected, computed from a stage-discharge relation or from a discharge measurement.

## PUBLICATIONS

Reports giving records of chemical quality and temperatures of surface waters and suspended-sediment loads of streams in the

area covered by this volume for the water years 1941-57, are listed below:

Numbers of water-supply papers containing records for  
Parts 1-4, 1941-57

| Year | WSP  | Year | WSP  | Year | WSP  | Year | WSP  |
|------|------|------|------|------|------|------|------|
| 1941 | 942  | 1946 | 1050 | 1951 | 1197 | 1956 | 1450 |
| 1942 | 950  | 1947 | 1102 | 1952 | 1250 | 1957 | 1520 |
| 1943 | 970  | 1948 | 1132 | 1953 | 1290 |      |      |
| 1944 | 1022 | 1949 | 1162 | 1954 | 1350 |      |      |
| 1945 | 1030 | 1950 | 1186 | 1955 | 1400 |      |      |

Geological Survey reports containing chemical quality, temperature, and sediment data obtained before 1941 are listed below. Publications dealing largely with the quality of ground-water supplies and only incidentally covering the chemical composition of surface waters are not included. Publications that are out of print are preceded by an asterisk.

Many of the reports listed are available for consultation in the larger public and institutional libraries. Copies of Geological Survey publications still in print may be purchased at a nominal cost from the Superintendent of Documents, Government Printing Office, Washington 25, D. C., who will, upon request, furnish lists giving prices.

## COOPERATION

Many Municipal, State, and Federal agencies assisted in collecting records for these quality-of-water investigations. In addition to the cooperative programs, many stations were operated from funds appropriated directly to the Geological Survey.

The table on p. 20 lists State and local agencies that cooperated in quality-of-water investigations in the drainage basins included in this volume, and the locations of quality-of-water district offices responsible for the data collected.

## DIVISION OF WORK

The quality-of-water program was conducted by the Water Resources Division of the Geological Survey, L. B. Leopold, chief hydraulic engineer, and S. K. Love, chief, Quality of Water Branch. The records were collected and prepared for publication

| State       | Cooperating agency                                                                                                                                                                                                                           | Drainage basin                                      | District office                                                                 |

## THAMES RIVER BASIN

## WILLIMANTIC RIVER NEAR SOUTH COVENTRY, CONN.

LOCATION.--At highway bridge about 700 feet downstream from gaging station, 1 mile downstream from Mill Brook, 2.4 miles southeast of South Coventry, Tolland County.

DRAINAGE AREA.--121 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 89 ppm Sept. 21-30; minimum, 36 ppm Apr. 5-10.

Hardness: Maximum, 45 ppm Apr. 4; minimum, 14 ppm Apr. 5-10.

Specific conductance: Maximum daily, 141 micromhos Sept. 22; minimum daily, 39 micromhos Apr. 7.

Water temperatures: Maximum, 77°F July 23, 24; minimum, freezing point on several days during January.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1501. River frozen at regular sampling point Jan. 2-16. Samples collected half a mile upstream on Jan. 7-10, 11-16. No appreciable inflow between sampling site and gaging station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micromhos at 25°C) | pH  | Color | Oxygen consumed |          |

a By compleximetric titration.

b Includes equivalent of 3 parts per million of carbonate ( $\text{CO}_3$ ).c Includes equivalent of 19 parts per million of carbonate ( $\text{CO}_3$ ).

d Represents 98 percent of days and 98 percent of runoff.

THAMES RIVER BASIN--Continued  
SHETUCKET RIVER NEAR WILLIMANTIC, CONN.

LOCATION.--At gaging station at Bingham Bridge, 500 feet upstream from New York, New Haven and Hartford Railroad bridge, 500 feet downstream from Potash Brook, 1.3 miles downstream from confluence of Willimantic and Natchaug Rivers, and 1½ miles southeast of Willimantic, Windham County, and 16.5 miles above mouth. DRAINAGE AREA.--401 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.  
EXTREMES, 1956-57.--Dissolved solids: Maximum, 114 ppm Sept. 21, 24, 26-28, 30; minimum, 42 ppm Apr. 1-9.

Hardness: Maximum, 61 ppm Dec. 30; minimum, 16 ppm Mar. 11-20.

Specific conductance: Maximum daily, 234 micromhos Sept. 30; minimum daily, 46 micromhos Mar. 11. Apr. 11.

Water temperatures: Maximum, 81°F July 22, 23, Aug. 1; minimum, freezing point on several days during January.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1501.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection   | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micromhos at 25°C) | pH  | Color | Oxygen consumed |          |

## SCANTIC RIVER AT BROAD BROOK, CONN.

LOCATION.--At bridge on State Highway 140, 300 feet downstream from gaging station, 1 mile southwest of town of Broad Brook, Hartford County, and 8½ miles upstream from mouth.

DRAINAGE AREA.--98.4 square miles.

RECORDS AVAILABLE.--Water temperatures: October 1953 to September 1957.

Sediment records.--November 1952 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 85°F June 18; minimum, freezing point on several days during December and January.

Sediment concentrations: Maximum daily 259 ppm Aug. 28; minimum daily, 2 ppm Oct. 13, 26, Feb. 24.

Sediment loads: Maximum daily, 185 tons Jan. 23; minimum daily 0.2 ton Oct. 26.

EXTREMES, 1952-57.--Water temperatures (1953-57): Maximum, 85°F June 18, 1957; minimum, freezing point on many days during winter months.

Sediment concentrations: Maximum daily, 721 ppm Oct. 16, 1955; minimum daily, 1 ppm Jan. 22, 23, 1953, Dec. 15, 1954.

Sediment loads: Maximum daily, 6,670 tons (estimated) Aug. 19, 1955; minimum daily, 0.2 ton Aug. 23, 1953, July 25, 1954, Aug. 4, 1955, Oct. 26, 1956.

REMARKS.--Records of specific conductance of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1501.

## CONNECTICUT RIVER BASIN--Continued

## SCANTIC RIVER AT BROAD BROOK, CONN.--Continued

Particle-size analyses of suspended sediment, water year October 1956 to September 1957  
 (Methods of analysis: B, bottom withdrawal tube; D, decantation; P, pipet; S, sieve; N, in native water;  
 W, in distilled water; C, chemically dispersed; M, mechanically dispersed)

a By compleximetric titration

## QUINNIPIAC RIVER BASIN

## QUINNIPIAC RIVER AT WALLINGFORD, CONN.

LOCATION.--At Quinnipiac Street Bridge, Wallingford, New Haven County, about 0.8 mile upstream from gaging station and 2.8 miles upstream from Worton Brook. DRAINAGE AREA.--109 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 174 ppm June 21-30; minimum, 103 ppm Apr. 11-20.

HARDNESS: Maximum, 95 ppm July 1-20; minimum, 46 ppm Apr. 6-10.

Specific conductance: Maximum daily, 285 micromhos June 24, Aug. 19; minimum daily, 110 micromhos Apr. 7.

Water temperatures: Maximum, 85°F June 18; minimum, freezing point on several days during January.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1501.

Chemical analyses. In parts per million, water year October 1956 to September 1957

| Date of collection   | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color | Oxygen consumed |          |

## NORTH ATLANTIC SLOPE BASINS, MAINE TO CONNECTICUT

## HOUSATONIC RIVER BASIN

## HOUSATONIC RIVER AT FALLS VILLAGE, CONN.

LOCATION.--At dam upstream from powerplant of Connecticut Power Co. and about 1.1 miles upstream from gaging station at Falls Village, Litchfield County.

DRAINAGE AREA.--632 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1955 to September 1956.

Water temperature: October 1955 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 81°F June 20; minimum, freezing point on many days during December, January, and February.

EXTREMES, 1955-57.--Water temperatures: Maximum 81°F June 20, 1957; minimum, freezing point on many days during winter months.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1501.

Temperature (°F) of water, water year October 1956 to September 1957

## PART 1B. NORTH ATLANTIC SLOPE BASINS, NEW YORK TO YORK RIVER

## HUDSON RIVER BASIN

## GLOWEGEE CREEK AT WEST MILTON, N. Y.

LOCATION.--Temperature recorder at gaging station at highway bridge, half a mile south of West Milton, Saratoga County, 1½ miles upstream from Kayaderosseras Creek and 4 miles northeast of Ballston Spa.

DRAINAGE AREA.--26.0 square miles

RECORDS AVAILABLE.--Chemical analyses: March 1953 to September 1956.

Water temperatures: March 1953 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 78°F June 27; minimum, freezing point on several days during December, January and March.

EXTREMES, 1953-57.--Water temperatures: Maximum, 81°F July 1953; minimum, freezing point on many days during winter months.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, August 1957

## HUDSON RIVER BASIN--Continued

## KAYADEROSSERAS CREEK NEAR WEST MILTON, N.Y.

LOCATION.--Temperature recorder at gaging station, 500 feet downstream from Gloweege Creek, 1 mile east of West Milton, Saratoga County, and 3½ miles northwest of Ballston Spa, approximately.

DRAINAGE AREA.--90 square miles approximately.

RECORDS AVAILABLE.--Chemical analyses: October 1953 to September 1955.

Water temperatures: October 1952 to September 1957.

Sediment records: February 1953 to June 1955.

EXTREMES, 1956-57.--Water temperatures: Maximum, 82°F June 18; minimum, freezing point on many days during December, January, February and March.

EXTREMES, 1949-57.--Water temperatures: Maximum, 83°F July 1955; minimum, freezing point on many days during winter months.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1302.

Chemical analyses, in parts per million, August 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180° C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25° C) | pH  | Color |

HUDSON RIVER BASIN--Continued

HUDSON RIVER AT MECHANICVILLE, N. Y.

LOCATION.--At west shore of Hudson River at West Virginia Pulp and Paper Co., Mechanicville, Saratoga County, N. Y.  
 DRAINAGE AREA.--4,500 square miles.  
 RECORDS AVAILABLE.--Water temperatures: October 1954 to September 1957.  
 EXTREMES, 1956-57.--Water temperatures: Maximum, 80°F June 17-19, 21-28; minimum, freezing point on many days during November, December, January, February and March.  
 EXTREMES, 1954-57.--Water temperatures: Maximum, 82°F Aug. 5-7, 1955; minimum, freezing point on many days during winter months.  
 REMARKS.--Plant not in operation Oct. 1 to Nov. 25.

Chemical analyses, in parts per million, February to May 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) |    | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## HUDSON RIVER BASIN--Continued

## MOHAWK RIVER NEAR LITTLE FALLS, N. Y.

LOCATION.-- At highway bridge about 3.2 miles upstream from gaging station, 2.9 miles from Rocky Rift dam, 5.2 miles upstream from East Canada Creek, and 1.3 miles southeast of Little Falls, Herkimer County.

DRAINAGE AREA.--1,348 square miles (above gaging station).

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957

Water temperatures: October 1956 to September 1957

EXTREMES, 1956-57.--Dissolved solids: Maximum, 170 ppm Sept. 11-30, minimum, 122 ppm Oct. 21-31, Mar. 21-31.

Hardness: Maximum, 124 ppm Aug. 1-10, Sept. 11-30; minimum, 84 ppm Oct. 21-31.

Specific conductance: Maximum daily, 314 microhos Sept. 13; minimum daily, 163 microhos Oct. 1.

Water temperatures: Maximum, 78° June 19, July 22; freezing point on several days during January and February.

REMARKS.--No samples taken Jan. 1-10, Feb. 1-10, river frozen. Records of specific conductance and pH of daily samples available in district office at Albany, N.Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection     | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | pH  | Color | Oxygen consumed |          |

## HUDSON RIVER BASIN--Continued

## MOHAWK RIVER AT VISCHER FERRY DAM, N. Y.

LOCATION --At bridge crossing headrace of Vischer Ferry powerplant operated by N. Y. State Department of Public Works.

DRAINAGE AREA 3,385 square miles.

RECORDS AVAILABLE --Chemical analyses: October 1951 to September 1953.

Water temperature: January 1947 to September 1957.

EXTREMES, 1936-57 --Water temperature: Maximum, 82° F. June 24; minimum, freezing point on many days during December, January, and February.

EXTREMES, 1947-57 --Water temperatures: Maximum, 85° F. Aug. 5, 1955; minimum, freezing point on many days during winter months.

## Chemical analysis, in parts per million, August 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180° C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25° C) | pH  | Color |

## HUDSON RIVER BASIN--Continued

## MOHAWK RIVER AT COHOES, N. Y.

LOCATION.--On bridge on Route 4 highway, 1,200 feet downstream of gaging station at Cohoes, Albany County.

DRAINAGE AREA.--3,456 square miles.

RECORDS AVAILABLE.--Water temperatures: May 1956 to September 1957.

Sediment records: January 1954 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 82°F July 21; minimum, freezing point on many days during winter months.

Sediment concentrations: Maximum daily, 102 ppm Jan. 24; minimum daily, 3 ppm Jan. 20.

Sediment loads: Maximum daily, 5,780 tons, Jan. 24, minimum daily, 1.7 tons Sept. 8.

EXTREMES, 1954-57.--Water temperatures (May 1956 to September 1957): Maximum, 82°F July 21,

1957; minimum, freezing point on many days during winter months.

Sediment concentrations: Maximum daily, 1,234 ppm Oct. 17, 1955; minimum daily, 1.0 ppm

July 18, 1954, and Jan. 6, 1956.

Sediment loads: Maximum daily, 300,000 tons Oct. 17, 1955; minimum daily, 0.8 ton Aug. 7,

1955.

REMARKS.--Records of specific conductance of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

## Chemical analysis in parts per million, Aug. 20, 1957

Total load for year (tons)..... 89,259.3

sComputed by subdividing day.

aComputed from estimated concentration graph.

## NORTH ATLANTIC SLOPE BASINS, NEW YORK TO YORK RIVER

## HUDSON RIVER BASIN--Continued

## HUDSON RIVER AT GREEN ISLAND, N. Y.

LOCATION.--At east shore of Green Island, Albany County, at Ford Motor Company power-plant, opposite Troy barge locks.

DRAINAGE AREA.--8,090 square miles, approximately (above gaging station).

RECORDS AVAILABLE.--Water temperatures: October 1954 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 80°F June 26; minimum, freezing point on many days during January and February.

EXTREMES, 1954-57.--Water temperatures: Maximum, 80°F June 26, 1957; minimum, freezing point on many days during winter months.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Temperature (°F) of water, water year October 1956 to September 1957

Once-daily measurement at approximately 8 a. m.

a Includes equivalent of 2 parts per million of carbonate (CO<sub>3</sub>).

## NORTH ATLANTIC SLOPE BASINS, NEW YORK TO YORK RIVER

## RARITAN RIVER BASIN

## STONY BROOK AT PRINCETON, N. J.

LOCATION.--At gaging station at Lawrenceville road bridge on U. S. Highway 206, 4 miles upstream from Carnegie Lake, and 1.6 miles southwest of Princeton, Mercer County.

DRAINAGE AREA.--44.5 square miles.

RECORDS AVAILABLE.--Water temperatures: October 1956 to September 1957.

Sediment records: January 1956 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 80°F Aug. 27, and Sept. 4; minimum, freezing point on several days during November to February.

Sediment concentrations: Maximum daily, 347 ppm Apr. 5; minimum daily, 0 ppm several days in October.

Sediment loads: Maximum daily, 1,400 tons Apr. 5; minimum daily, 0 tons several days in October.

EXTREMES, January 1956 to September 1957.--Sediment concentrations: Maximum daily, 427 ppm Mar. 14, 1956; minimum daily, 0 ppm several days.

Sediment loads: Maximum daily, 1,880 tons Mar. 14, 1956; minimum daily, 0 tons several days.

REMARKS.--Station established January 1956 for the Stony Brook watershed project. Records of specific conductance and pH sampled on a periodic basis are available in the subdistrict office at Harrisburg, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1552.

Temperature (°F) of water, water year October 1956 to September 1957

RARITAN RIVER BASIN--Continued  
DELAWARE AND RARITAN CANAL AT TRENTON, N. J.

LOCATION.--At Rose Street and Holland Avenue in Trenton, Mercer County.

DRAINAGE AREA.--120 square miles

RECORDS AVAILABLE.--Chemical analyses: February 1956 to September 1957.

REMARKS.--Records of specific conductance and temperatures of daily samples for period October 1956 to July 1957 available in district office at Philadelphia, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## DELAWARE RIVER AT PORT JERVIS, N. Y.

LOCATION.--At gaging station at bridge on U.S. Highways 6 and 209 at Port Jervis, Orange County, 1½ miles upstream from Neversink River and 6.5 miles downstream from Mongaup River.

DRAINAGE AREA.--3,076 square miles.

RECORDS AVAILABLE.--Water temperatures: February to September 1957.

Sediment records: February to September 1957.

EXTREMES, February to September 1957.--Water temperatures: Maximum, 82°F July 21, 22.

Sediment concentrations: Maximum daily, 213 ppm Apr. 6; minimum daily, 0.3 ppm Aug. 29.

Sediment loads: Maximum daily, 19,800 tons Apr. 7; minimum daily, 0.8 ton Aug. 29.

REMARKS.--Records of specific conductance of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Temperature (°F) of water, February to September 1957

Total discharge for period February 14 to September 30 (cfs-days) ..... 847,232  
 Total load for period February 14 to September 30 (tons) ..... 67,516.7

DELAWARE RIVER BASIN--Continued  
DELAWARE RIVER AT MONTAGUE, N. J.

LOCATION --At center of toll bridge at Montague, N. J. Sussex County, 0.4 mile downstream from gaging station and approximately 1.2 miles downstream from Saw Kill.

DRAINAGE AREA--3,480 square miles.

RECORDS AVAILABLE--Chemical analyses: October 1956 to September 1957.

WATER TEMPERATURES--October 1956 to September 1957.

EXTREMES, 1956-57.--Specific conductance: Maximum daily, 163 micromhos June 18; minimum daily, 46 micromhos Apr. 7.

WATER TEMPERATURES--Maximum 81°F July 22; minimum, freezing point Feb. 1.

REMARKS.--Records of specific conductance of daily samples available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection                | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## DELAWARE RIVER BASIN--Continued

## LEHIGH RIVER AT GLENDON, PA.

LOCATION.--At highway bridge in Glendon, Northampton County, approximately 1 mile below Chain Dam, and 2 1/4 miles above the junction of the Lehigh and Delaware Rivers.

DRAINAGE AREA.--1,350 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES 1956-57.--Hardness: Maximum, 132 ppm Aug. 16 to Sept. 5; minimum, 48 ppm Dec. 21-31; Apr. 8-14.

Specific conductance: Maximum daily, 388 micromhos Aug. 24; minimum daily, 111 micromhos Apr. 10.

Water temperatures: Maximum, 86°F June 18; minimum, 34°F Jan. 15, 16, 18.

REMARKS.--Records of specific conductance of daily samples available in district office at Philadelphia, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## DELAWARE RIVER BASIN--Continued

DELAWARE RIVER AT TRENTON, N. J. (MORRISVILLE, PA.)

LOCATION.--At Calhoun Street Bridge, Bucks County, Pennsylvania side, 200 feet downstream from gaging station, which is half a mile upstream from Assunpink Creek. Chemical quality samples collected at Morrisville Filter Plant; sediment samples collected at midstream from bridge.

DRAINAGE AREA.--6,780 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1944 to September 1957.

Water temperatures: October 1944 to January 1955, December 1955 to September 1957.

Sediment records: September 1949 to September 1957.

EXTREMES, 1956-57.--Hardness: Maximum, 68 ppm July 26 to Aug. 15; Aug. 27 to Sept. 14; minimum, 42 ppm May 23-29.

Specific conductance: Maximum daily, 307 microhmhos May 30; minimum daily, 82 microhmhos Apr. 10.

Water temperatures: Maximum, 93°F June 18; minimum, freezing point on many days during January.

Sediment concentrations: Maximum daily, 532 ppm Apr. 7; minimum daily, 2 ppm Feb. 22-26.

Sediment loads: Maximum daily, 100,000 tons Apr. 7; minimum daily, 14 tons Sept. 1-4.

EXTREMES, 1944-57.--Dissolved solids (1944-47, 1950-51, 1953-57): Maximum, 165 ppm Oct. 1-9, 1953; minimum, 44 ppm Mar. 21-31, 1945.

Hardness (1944-47, 1949-57): Maximum, 103 ppm Oct. 1-9, 1953; minimum, 25 ppm Apr. 1-10, 1955; Feb. 21-28, 1954.

Specific conductance: Maximum daily, 370 microhmhos Aug. 1, 1955; minimum daily, 58 microhmhos Apr. 1, 1951.

Water temperatures: Maximum, 93°F June 18, 1957; minimum, freezing point on many days during winter months.

Sediment concentrations (1949-57): Maximum daily, 1,720 ppm Nov. 26, 1950; minimum daily, 0 ppm Oct. 21, 1952.

Sediment loads (1949-57): Maximum daily, 1,087,000 tons Aug. 20, 1955; minimum daily, 0 tons Oct. 21, 1952.

REMARKS.--Records of specific conductance of daily samples available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection         | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (microhmhos at 25°C) | pH  | Color |

DELAWARE RIVER BASIN--Continued  
DELAWARE RIVER AT BRISTOL, PA.--BURLINGTON, N. J. BRIDGE

RECORDS AVAILABLE.--Chemical analyses: August 1949 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 82° F. June 27; minimum, 33° F. on several days during January.

EXTREMES, 1954-56.--Water temperatures: Maximum, 83° F. July 21-28, 1955; minimum, freezing point on many days during winter months.

REMARKS.--Samples taken at center of stream approximately 3 feet from bottom. Additional data published in WSP 1262, Chemical characteristics of Delaware River water, Trenton, N. J. to Marcus Hook, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

DELAWARE RIVER BASIN--Continued  
DELAWARE RIVER AT TORRESDALE INTAKE, PHILADELPHIA, PA.

RECORDS AVAILABLE.--Chemical analyses: August 1949 to September 1957.

Water temperatures: October 1956 to September 1957.  
 EXTREMES.--Water temperatures: Maximum, 83° on several days during June and July; minimum, 33° on several days during January.  
 REMARKS.--Samples taken at Torresdale Intake at center of stream approximately 3 feet from bottom. Temperature recorder at Torresdale Filter Plant.  
 Additional data published in WSP 1262, Chemical characteristics of Delaware River water, Trenton, N. J. to Marcus Hook, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) at Trenton, N.J. | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | pH  | Color | Biochemical oxygen demand <sup>a</sup> | Dissolved oxygen |

<sup>a</sup> Samples taken approximately 3 feet from surface.

## DELAWARE RIVER BASIN--Continued

## DELAWARE RIVER AT PHILADELPHIA, PA.--BENJAMIN FRANKLIN BRIDGE (PHILADELPHIA-CAMDEN BRIDGE)

RECORDS AVAILABLE.--Chemical analyses: August 1949 to September 1957.

REMARKS.--Samples taken at center of stream approximately 3 feet from bottom. Additional data published in WSP 1262, Chemical characteristics of Delaware River water, Trenton, N. J. to Marcus Hook, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

## DELAWARE RIVER BASIN--Continued

## SCHULKILL RIVER AT BERNE, PA.

LOCATION.--At gaging station at highway bridge at Berne, Berks County, 0.5 mile upstream from Mill Creek, and 6.5 miles downstream from Little Schulkill River.

DRAINAGE AREA.--355 square miles.

RECORDS AVAILABLE.--Chemical analyses: December 1947 to February 1953, October 1956 to September 1957.

Water temperatures: February 1948 to April 1953, December 1956 to September 1957.

Sediment records: October 1947 to September 1957.

EXTREMES, 1956-57.--Specific conductance: Maximum daily, 940 micromhos Aug. 26; minimum daily, 152 micromhos Apr. 6.

Water temperatures: Maximum, 90°F June 17; minimum, freezing point on many days during January.

Sediment concentrations: Maximum daily, 470 ppm Apr. 6; minimum daily, 1 ppm on many days.

Sediment loads: Maximum daily, 11,300 tons Apr. 6; minimum daily, less than 0.50 ton during July, August, September.

EXTREMES, 1947-57.--Dissolved solids (1947-53): Maximum, 775 ppm Sept. 11-20, 1948; minimum, 155 ppm Dec. 11-14, 1952.

Hardness (1947-53): Maximum, 501 ppm Sept. 11-20, 1948; minimum, 98 ppm Nov. 21-31, 1950.

Specific conductance (1947-53) (1956-57): Maximum daily, 1,040 micromhos Oct. 23, 1951; minimum daily, 152 micromhos Apr. 6, 1957.

Water temperatures (1948-53, 1956-57): Maximum, 90°F June 17, 1957; minimum, freezing point on many days during winter months.

Sediment concentrations: Maximum daily, 8,030 ppm Nov. 4, 1947; minimum daily, 0 ppm many days during 1952 water year.

Sediment loads: Maximum daily, 90,180 tons Nov. 12, 1947; minimum daily, 0 tons on many days during 1952 water year.

REMARKS.--Records of specific conductance and pH of daily sample available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502. Flow affected by ice Jan. 2-4, 12-23.

Chemical analyses, in parts per million, water year October 1956 to September 1957

Total discharge for year (cfs-days) ..... 228,237  
 Total load for year (tons) ..... 22,594.9

s Computed by subdividing day.

t Less than 0.50 ton.

## DELAWARE RIVER BASIN--Continued

## SCHUYLKILL RIVER AT MANAYUNK, PHILADELPHIA, PA.

LOCATION.--At Green Lane Avenue Bridge, 5 miles upstream from gaging station at Fairmount Dam, Philadelphia County.

DRAINAGE AREA.--1,893 square miles (at Fairmount Dam.)

RECORDS AVAILABLE.--Water temperatures: November 1956 to September 1957.

Sediment records: November 1947 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 92°F, June 19; minimum, freezing point on several days during January.

Sediment concentrations: Maximum daily 850 ppm, Apr. 6; minimum daily, 1 ppm Apr. 28.

Sediment loads: Maximum daily, estimated, 60,000 tons, Apr. 6; minimum daily 8 tons, Apr. 28.

EXTREMES, 1947-57.--Sediment concentrations: Maximum daily, 4,910 ppm Dec. 30, 1948; minimum daily, 1 ppm on several days during each year.

Sediment loads: Maximum daily, estimated 650,000 tons Aug. 19, 1955; minimum daily, 2 tons on several days during each year.

REMARKS.--Records of specific conductance and pH of random samples available at the Harrisburg subdistrict office. Records of discharge for water year October 1956 to September 1957 for the Schuylkill River at Philadelphia (Fairmount Dam) given in WSP 1502, and includes water diverted by the City of Philadelphia for municipal water supply.

Total discharge for year (cfs-days)..... 922,392

Total load for year (tons)..... 200,685

s Computed by subdividing day.

a Computed from estimated water discharge.

c Computed from partly estimated concentration graph.

## DELAWARE RIVER BASIN--Continued

## SCHUYLKILL RIVER AT MANAYUNK, PHILADELPHIA, PA.--Continued

Particle-size analyses of suspended sediment, water year October 1956 to September 1957

(Methods of analysis: B, bottom withdrawal tube; D, decantation; P, pipet ; S, sieve; N, in native water; W, in distilled water; C, chemically dispersed; M, mechanically dispersed)

## DELAWARE RIVER BASIN--Continued

## SCHUYLKILL RIVER AT BELMONT FILTER PLANT, PHILADELPHIA, PA.

LOCATION.--At Belmont Filter Plant, Philadelphia, Philadelphia County, 1.6 miles upstream from gaging station which is 40 feet upstream from Fairmount Dam.

DRAINAGE AREA, 893 square miles (above Fairmount Dam).

RECORDS AVAILABLE.--Chemical analyses October 1945 to September 1957.

Water temperatures: October 1945 to September 1957.

EXTREMES, 1956-57.--Hardness: Maximum, 242 ppm Aug. 13 to Sept. 4; minimum, 70 ppm Apr. 6-10.

Specific conductance: Maximum daily, 364 micromhos Aug. 25, 27, Sept. 1; minimum, 167 micromhos Apr. 7.

Water temperatures: Maximum, 87 F June 19, 20; minimum, 33 F Jan. 28.

EXTREMES, 1944-57.--Dissolved solids (1944-56): Maximum, 362 ppm Oct. 21-30, 1953; minimum, 94 ppm Feb. 1-10 and Feb. 21-28, 1951.

Hardness: Maximum, 231 ppm Oct. 4-9, 1951; minimum, 70 ppm Apr. 6-10, 1957.

Specific conductance: Maximum daily, 368 micromhos Oct. 7, 1951; minimum daily, 154 micromhos Apr. 29, 1952.

Water temperatures: Maximum, 88 F July 20, Aug. 7, 1955; minimum, freezing point on many days during winter months.

REMARKS.--Samples collected at raw-water intake on west side of river at Belmont Filter Plant by City of Philadelphia. Records of specific

conductance of daily samples available in district office at Philadelphia, Pa. Records of discharge for Schuylkill River at Philadelphia

for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection    | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## DELAWARE RIVER BASIN--Continued

## DELAWARE RIVER AT EDDYSTONE, PA.

RECORDS AVAILABLE.--Chemical analyses: August 1949 to September 1957.

REMARKS.--Samples taken at center of stream approximately 3 feet from surface and 3 feet from bottom. Additional data published in WSP 1262, Chemical characteristics of Delaware River water, Trenton, N. J. to Marcus Hook, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection  | Sampling station | Discharge at Trenton (cfs) | Chloride (Cl) | Specific conductance (micro-mhos at 25°C) | pH  | Biochemical oxygen demand | Dissolved oxygen |
|---------------------|------------------|----------------------------|---------------|-------------------------------------------|-----|---------------------------|------------------|

DELAWARE RIVER BASIN--Continued  
DELAWARE RIVER AT MARCUS HOOK, PA.

RECORDS AVAILABLE.--Chemical analyses: August 1949 to September 1957.  
REMARKS.--Samples taken at center of stream approximately 3 feet from surface and 3 feet from bottom. Additional data published in WSP 1262, Chemical characteristics of Delaware River water, Trenton, N. J. to Marcus Hook, Pa.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Sampling station | Discharge at Trenton (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color | Biochemical oxygen demand | Dissolved oxygen |

DELAWARE RIVER BASIN--Continued  
BRANDYWINE CREEK AT WILMINGTON, DEL.

LOCATION.--At Henry Clay Bridge in Wilmington, New Castle County, 0.2 mile upstream from gaging station, and 4.4 miles upstream from mouth.  
DRAINAGE AREA.--314 square miles, approximately.

RECORDS AVAILABLE.--Chemical analyses: October 1947 to September 1950, October 1952 to July 1953, March 1956 to September 1957.

Water temperatures: November 1956 to September 1957.

Sediment records: December 1946 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 86°F June 17; minimum, freezing point on several days during December and January.

Sediment concentrations: Maximum daily, 1,470 ppm Nov. 2; minimum daily, 1 ppm Sept. 16.

Sediment loads: Maximum daily, 21,600 tons Nov. 2; minimum daily, less than 0.50 ton Sept. 16.

EXTREMES, 1946-57.--Sediment concentrations: Maximum daily, 1,470 ppm Nov. 2, 1956; minimum daily, 1 ppm on many days.

Sediment loads: Maximum daily, 21,600 tons Nov. 2, 1956; minimum daily, less than 0.50 ton on many days.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

Total discharge for year (cfs-days) ..... 126,691

Total load for year (tons) ..... 35,182

s Computed by subdividing day.

t Less than 0.50 ton.

## DELAWARE RIVER BASIN--Continued

## DELAWARE RIVER AT MEMORIAL BRIDGE, WILMINGTON, DEL.

LOCATION.--Center of the navigation channel at the center of the Delaware Memorial Bridge, 1.9 miles downstream from the mouth of the Christina River.

DRAINAGE AREA.--11,030 square miles.

RECORDS AVAILABLE.--Chemical analyses: July 1955 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES: 1956-57.--Water temperatures: Maximum, 83°F June 26, 28; minimum, freezing point Jan. 17, 18, 21, 22.

REMARKS.--Maximum and minimum daily records of specific conductance taken from continuous conductivity recorder available in district office at Philadelphia, Pa. Records of discharge for gaging station at Trenton, N. J. for water year October 1956 to September 1957 in WSP 1502.

Chemical analyses in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) at Trenton, N. J. | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## DELAWARE RIVER BASIN--Continued

## DELAWARE RIVER AT REEDY POINT, DEL.

LOCATION.--One hundred yards west of buoy "IN", 0.8 mile southeast of the Chesapeake and Delaware Canal and 2.1 miles south of Pea Patch Island.  
DRAINAGE AREA.--11,220 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1955 to September 1957.

Water temperatures: October 1956 to September 1957. Maximum daily, 19.100 micromhos Aug. 27; minimum daily, 222 micromhos Apr. 16.  
EXTREMES, 1956-57.--Specific conductance: Maximum, 85°F June 17; minimum, freezing point Jan. 17, 28.

Water temperatures: Maximum, 85°F June 17; minimum, freezing point Jan. 17, 28.  
REMARKS.--Composited samples selected from representative daily samples collected one hour prior to high-water slack, 3 feet below surface. Single-dated samples collected at center of channel 3 feet from bottom, during course of service trips. Records of specific conductance of daily samples available in district office at Philadelphia, Pa. Records of discharge for gaging station at Trenton, N. J. for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

SUSQUEHANNA RIVER BASIN  
UNADILLA RIVER AT ROCKDALE, N. Y.

LOCATION.-- At gaging station at highway bridge, Rockdale, Chenango County and three-quarters of mile downstream from Kent Brook.  
DRAINAGE AREA.-- 518 square miles.

RECORDS AVAILABLE.-- Chemical analyses: October 1956 to September 1957.  
Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 144 ppm Aug. 21-31; minimum, 83 ppm Dec. 11-20.  
Hardness: Maximum, 119 ppm Aug. 21-31; minimum, 46 ppm Jan. 23-24.

Specific conductance: Maximum daily, 260 micromhos Aug. 22; minimum daily, 93 micromhos Jan. 23.

Water temperatures: Maximum 79°F July 22, 23, 28; minimum, freezing point on many days during December, January, February and March.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Albany, N.Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 100°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color | Oxygen consumed |          |

## SUSQUEHANNA RIVER BASIN--Continued

## CHENANGO RIVER AT GREENE, N. Y.

LOCATION.--At highway bridge about 1,700 feet upstream from gaging station, at Greene, Chenango County and about 940 feet downstream from Birdsall Creek. DRAINAGE AREA.--598 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 163 ppm Sept. 1-20; minimum, 83 ppm Dec. 11-20.

Hardness: Maximum, 136 ppm Sept. 1-20; minimum, 44 ppm Jan. 23, 24.

Specific conductance: Maximum daily, 326 micromhos Sept. 17; minimum daily, 91 micromhos Jan. 23.

Water temperatures: Maximum, 77°F June 19; minimum, freezing point Jan. 5, 14, 19, 20.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1502. No appreciable inflow between sampling site and gaging station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

SUSQUEHANNA RIVER BASIN--Continued  
 TIOUGHNIOGA RIVER AT CORTLAND, N. Y.

LOCATION --At bridge on highway 11 at Cortland, Cortland County, about 0.3 mile downstream from gaging station and about 0.7 mile from confluence of East and West Branches.  
 DRAINAGE AREA --296 square miles (including 16 square miles, the flow from which may be diverted into DeRuyter Reservoir in Oswego River basin).  
 RECORDS AVAILABLE --Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES 1956-57 Dissolved solids: Maximum, 180 ppm Sept. 1-10; minimum, 87 ppm Dec. 21-29.

HARDNESS: Maximum 166 ppm Jan. 21; minimum, 40 ppm Apr. 6, 7.

Specific conductance: Maximum 411, 353 micromhos at 25°C, 41, 35 micromhos at 25°C, 23 micromhos at 25°C, 23 micromhos at 25°C.

Water temperatures: Maximum 74°F, July 22; minimum, freezing point on many days during winter months.

REMARKS --Records of specific conductance and pH of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP-1502. No appreciable inflow between gaging station and sampling site.

Chemical analyses, in parts per million, water year October 1956 to September 1957

## SUSQUEHANNA RIVER BASIN--Continued

## SUSQUEHANNA RIVER AT JOHNSON CITY, N. Y.

LOCATION.--At the New York State Electric and Gas Corp., Goudy Station, Johnson City, N. Y.

DRAINAGE AREA.--3,916 square miles.

RECORDS AVAILABLE.--Water temperatures: October 1955 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 81°F June 19, July 22; minimum, freezing point Jan. 7-8, 28, Feb. 12, 28.

EXTREMES, 1955-57.--Water temperatures: Maximum, 81°F June 19, July 22, 1957, minimum, freezing point on many days during winter months.

REMARKS.--Water is brought to plant underground through tubes. Measurements are made at plant which is approximately 200 feet from river. Readings made by employees of plant.

Temperature (°F) of water, water year October 1956 to September 1957

/Once-daily measurement at approximately 8 a. m. /

| Day     | Oct. | Nov. | Dec. | Jan. | Feb. | Mar. | Apr. | May | June | July | Aug. | Sept. |

## SUSQUEHANNA RIVER BASIN--Continued

## COREY CREEK NEAR MAINESBURG, PA.

LOCATION.--At gaging station, 1.1 miles downstream from Mainesburg, Tioga County, 3½ miles east of Mansfield, and 4½ miles upstream from mouth.

DRAINAGE AREA.--12.2 square miles.

RECORDS AVAILABLE.--Sediment records: May 1954 to September 1957.

EXTREMES, 1956-57.--Sediment concentrations: Maximum daily, 1,440 ppm Apr. 5; minimum daily, 0 ppm Aug. 17-19.

Sediment loads: Maximum daily, 1,460 tons Apr. 5; minimum daily, 0 tons Aug. 17-19.

EXTREMES, 1954-57.--Sediment concentrations: Maximum daily, 1,440 ppm Apr. 5, 1957; minimum daily, 0 ppm on many days.

Sediment loads: Maximum daily, 1,940 tons Oct. 14, 1955; minimum daily, 0 tons on many days.

REMARKS.--Records of specific conductance and pH of periodic sediment samples available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502. Flow affected by ice Nov. 23-27, Nov. 30 to Dec. 4, Dec. 10-12, Dec. 29 to Jan. 23, Jan. 25 to Feb. 6, Feb. 12-23, Mar. 2-7.

## Chemical analysis, in parts per million, Dec. 10, 1956

|                                 |     |                                          |     |
|---------------------------------|-----|------------------------------------------|-----|
| Silica (SiO <sub>2</sub> )      | 4.6 | Nitrate (NO <sub>3</sub> )               | 1.6 |
| Iron (Fe)                       | .01 | Dissolved solids (residue at 180°C)      | 78  |
| Manganese (Mn)                  | .00 | Hardness as CaCO <sub>3</sub>            |     |
| Calcium (Ca)                    | 15  | Calcium, magnesium                       | 47  |
| Magnesium (Mg)                  | 2.3 | Noncarbonate                             | 16  |
| Sodium (Na)                     | 2.0 | Specific conductance (micromhos at 25°C) | 113 |
| Potassium (K)                   | 1.7 | pH                                       | 7.8 |
| Bicarbonate (HCO <sub>3</sub> ) | 38  | Color                                    | 3   |

e Estimated.

s Computed by subdividing day.

t Less than 0.05 ton.

a Computed from partly estimated concentration graph.

b Computed from estimated concentration graph.

c Computed from estimated water discharge.

Total discharge for year (cfs-days) ..... 4,593.0

Total load for year (tons) ..... 2,793.1

s Computed by subdividing day.

b Computed from estimated concentration graph.

t Less than 0.05 ton.

## SUSQUEHANNA RIVER BASIN--Continued

## COREY CREEK NEAR MAINESBURG, PA.--Continued

Particle-size analyses of suspended sediment, water year October 1956 to September 1957

(Methods of analysis: B, bottom withdrawal tube; D, decantation; F, pipet; S, sieve; N, in native water;

W, in distilled water; C, chemically dispersed; M, mechanically dispersed)

## SUSQUEHANNA RIVER BASIN--Continued

## ELK RUN NEAR MAINESBURG, PA.

LOCATION.--At gaging station, 2.7 miles northeast of Mainesburg, Tioga County, 5½ miles upstream from mouth, and 5.8 miles east of Mansfield.

DRAINAGE AREA.--10.2 square miles.

RECORDS AVAILABLE.--Water temperatures: November 1956 to September 1957.

Sediment records: May 1954 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 83°F June 17; minimum, freezing point on several days.

Sediment concentrations: Maximum daily, 885 ppm Apr. 5; minimum daily, 0 ppm on many days during August and September.

Sediment loads: Maximum daily, 852 tons Apr. 5; minimum daily, 0 tons on many days during August and September.

EXTREMES, 1954-57.--Sediment concentrations: Maximum daily, 885 ppm Apr. 5, 1957; minimum daily, 0 ppm on many days.

Sediment loads: Maximum daily, 852 tons Apr. 5, 1957; minimum daily, 0 tons on many days.

REMARKS.--Records of specific conductance and pH of periodic sediment samples available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502. Flow affected by ice Nov. 20-26, Dec. 10-12, 19, Dec. 24 to Feb. 8, Feb. 12-22, Feb. 28 to Mar. 7.

## Chemical analysis, in parts per million, Dec. 10, 1956

s Computed by subdividing day.

a Computed from partly estimated concentration graph.

t Less than 0.05 ton.

b Computed from estimated concentration graph.

SUSQUEHANNA RIVER BASIN--Continued  
ELK RUN NEAR MAINESBURG, PA.--Continued

Particle-size analyses of suspended sediment, water, year October 1956 to September 1957  
(Methods of analysis: B, bottom withdrawal tube; D, decantation; F, pipet; S, sieve; N, in native water;  
W, in distilled water; C, chemically dispersed; M, mechanically dispersed)

SUSQUEHANNA RIVER BASIN--Continued  
CANISTEO RIVER AT WEST CAMERON, N. Y.

LOCATION.--At bridge 250 feet upstream from gaging station, a quarter of a mile southeast of West Cameron, Steuben County, and 2 miles upstream from Cameron. DRAINAGE AREA.--342 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES 1956-57.--Dissolved solids: Maximum, 267 ppm Sept. 1-10; minimum, 97 ppm Apr. 11-20.

Hardness: Maximum, 197 ppm Sept. 1-10; minimum, 54 ppm Jan. 23.

Specific conductance: Maximum daily, 477 microhos Sept. 1; minimum daily, 108 microhos Jan. 23.

Water temperatures: Maximum, 84°F June 18; minimum, freezing point on many days during December, January and February.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Albany, N. Y. Records of discharge for water year October 1956 to September 1957 given in WSP 1502. River frozen Jan. 14-21. No appreciable inflow between sampling site and gaging station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

## SUSQUEHANNA RIVER BASIN--Continued

## SUSQUEHANNA RIVER AT DANVILLE, PA.

LOCATION.--At gaging station at Mill Street Bridge on state highway 54 at Danville, Montour County, 0.8 mile upstream from Mahoning Creek.  
DRAINAGE AREA.--11,220 square miles, approximately.  
RECORDS AVAILABLE.--Chemical analyses: September 1956 to September 1957.  
water temperatures: October 1945 to June 1953, October 1945 to June 1953, February 1956 to September 1957.  
EXTREMES, 1956-57.--Hardness: Maximum, 220 ppm Sept. 1-27; minimum, 42 ppm Apr. 6-14.  
Specific conductance: Maximum daily, 556 micromhos Sept. 22; minimum daily, 100 micromhos Apr. 7.  
Water temperature: Maximum, 86° F June 17, 18; minimum, freezing point Jan. 15, 18.  
EXTREMES, 1945-53, 1956-57.--Dissolved solids (1945-53): Maximum, 334 ppm Sept. 11-20, 1946; minimum, 68 ppm May 21-31, 1946.  
Hardness (1945-47, 1949-53, 1956-57): Maximum, 232 ppm Nov. 1-10, 1952; minimum, 42 ppm Apr. 1-10, 1950, Apr. 6-14, 1957.  
Specific conductance: Maximum daily, 557 micromhos Oct. 13, 1948; minimum daily, 94 micromhos Dec. 6, 1950.  
Water temperatures: Maximum, 87° F Aug. 9, 10, 1949; minimum, freezing point on many days during winter months.  
REMARKS.--Records of specific conductance of daily samples available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection   | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## SUSQUEHANNA RIVER BASIN--Continued

## NORTH BALD EAGLE CREEK BELOW SPRING CREEK, AT MILESBURG, PA.

LOCATION.--At bridge on U. S. Highway 220, in Milesburg, Centre County, 130 feet upstream from gaging station and 120 feet downstream from Spring Creek.

DRAINAGE AREA.--265 square miles.

RECORDS AVAILABLE.--Temperature records: November 1956 to September 1957.

Sediment records: December 1955 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 82°F July 21, 22; minimum, 35°F Mar. 8.

Sediment concentrations: Maximum daily, 157 ppm Apr. 6; minimum daily, 2 ppm on several days during the year.

Sediment loads: Maximum daily, 1,180 tons Apr. 6; minimum daily, 1 ton on several days during October and September.

EXTREMES, 1955-57.--Sediment concentrations: Maximum daily, 788 ppm Feb. 25, 1956; minimum daily, 1 ppm July 12, 1956.

Sediment loads: Maximum daily, 6,250 tons Feb. 25, 1956; minimum daily, 1 ton on several days.

REMARKS.--Records of discharge for period October 1956 to September 1957 given in WSP 1502.

e Estimated.

s Computed by subdividing day.

a Computed from partly estimated concentration graph.

b Computed from estimated concentration graph.

## SUSQUEHANNA RIVER BASIN--Continued

## NORTH BALD EAGLE CREEK AT BLANCHARD, PA.

LOCATION.--At gaging station, 0.7 mile upstream from Marsh Creek, and 0.9 mile south of Blanchard, Centre County.

DRAINAGE AREA.--339 square miles.

RECORDS AVAILABLE.--Water temperatures: October 1956 to September 1957.

Sediment records: December 1955 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 91°F June 30; minimum, freezing point Jan. 13, 14.

Sediment concentrations: Maximum daily, 203 ppm Apr. 6; minimum daily, 1 ton on many days.

Sediment loads: Maximum daily, 1,800 tons Apr. 6; minimum daily, 1 ton on many days.

EXTREMES, 1955-57.--Sediment concentrations: Maximum daily, 349 ppm Feb. 25, 1956;

minimum daily, 1 ppm on many days.

Sediment loads: Maximum daily, 2,340 tons Mar. 8, 1956; minimum daily, less than 0.5 ton Jan. 1-5, 1956.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

## Chemical analyses, in parts per million, October 1956, January 1957

## SUSQUEHANNA RIVER BASIN--Continued

## MARSH CREEK AT BLANCHARD, PA.

LOCATION.--At gaging station on highway bridge, 0.5 mile southwest of Blanchard, Centre County, and 0.6 mile upstream from mouth.

DRAINAGE AREA.--44.1 square miles.

RECORDS AVAILABLE.--Water temperatures: October 1956 to September 1957.

Sediment records: November 1955 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 84°F June 15, 17, 18; minimum, freezing point on several days during January.

Sediment concentrations: Maximum daily, 197 ppm Apr. 8; minimum daily, 0 ppm on several days during October.

Sediment loads: Maximum daily, 428 tons Apr. 8; minimum daily, 0 tons on several days during October.

EXTREMES, 1955-57.--Sediment concentrations: Maximum daily, 682 ppm Feb. 18, 1956; minimum daily, 0 ppm on many days.

Sediment loads: Maximum daily, 939 tons Feb. 25, 1956, minimum daily, 0 tons on many days.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1502. Flow affected by ice Jan. 11-25.

## Chemical analysis, in parts per million, Jan. 30, 1957

|                                       |     |                                 |     |

Total discharge for year (cfs-days)..... 21,468.3

Total load for year (tons)..... 2,659.4

s Computed by subdividing day.

a Computed from partly estimated concentration graph.

t Less than 0.05 ton.

b Computed from estimated concentration graph.

SUSQUEHANNA RIVER BASIN--Continued

WEST BRANCH SUSQUEHANNA RIVER AT LEWISBURG, PA.

LOCATION.--At gaging station at Market Street Bridge at Buffalo Creek and 7.4 miles upstream from mouth.

DRAINAGE AREA.--6,847 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1944 to June 1953, October 1956 to September 1957.

Water temperatures: October 1944 to June 1953, October 1956 to September 1957.

EXTREMES, 1956-57.--Hardness: Maximum, 156 ppm Aug. 26 to Sept. 6; minimum, 36 ppm Mar. 17 to Apr. 5, 7-16.

Specific conductance: Maximum daily, 423 microhos Aug. 26; minimum daily, 63 microhos Nov. 3.

Water temperatures: Maximum, 82°F June 25, July 22; minimum, freezing point on many days during the winter months.

EXTREMES, 1944-53, 1956-57.--Dissolved solids (1944-47): Maximum, 219 ppm Oct. 1-10, 1944; minimum, 46 ppm May 1-10, 1945.

Hardness: Maximum, 156 ppm Oct. 1-10, 1951 Aug. 26 to Sept. 6, 1957; minimum, 26 ppm May 21-31, 1946.

Specific conductance: Maximum daily, 423 microhos Aug. 26, 1957; minimum daily, 63 microhos Nov. 3, 1956.

Water temperatures: Maximum, 90°F July 28, Aug. 10, 1949; minimum, freezing point on many days during the winter months.

REMARKS.--Records of specific conductance of daily samples available in district office in Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection         | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (microhos at 25°C) | pH  | Color |

## SUSQUEHANNA RIVER BASIN--Continued

## JUNIATA RIVER AT NEWPORT, PA.

LOCATION.--At gaging station at highway bridge at Newport, Perry County, 1,000 feet upstream from Little Buffalo Creek, and 230 feet from west bank of river. DRAINAGE AREA.--3,354 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1944 to June 1953, February 1956 to September 1957.

Water temperatures: October 1944 to June 1953.

Sediment records: January 1951 to September 1957.

EXTREMES, 1956-57.--Specific conductance: Maximum daily, 445 micromhos Sept. 3, 11; minimum daily, 112 micromhos Nov. 2. Sediment concentrations: Maximum daily, 529 ppm Nov. 2; minimum daily, 0 ppm on many days during the year.

Sediment loads: Maximum daily, 36,200 tons Nov. 2; minimum daily, 0 tons many days during the year.

EXTREMES, 1944-53, 1956-57.--Dissolved solids (1944-47, 1949-51): Maximum 282 ppm Oct. 10, 1944; minimum, 74 ppm Feb. 11-20, 1950.

Hardness (1944-47, 1949-53): Maximum, 170 ppm Nov. 1-10, 1952; minimum, 14 ppm Feb. 21-28, Apr. 1-10, 1951.

Specific conductance: Maximum daily, 465 micromhos Oct. 1, 1944; minimum daily, 74 micromhos Nov. 25, 1950.

Water temperatures: Maximum daily, 89°F July 22, 1952; minimum, freezing point on many days during winter months.

Sediment concentrations (1944-53): Maximum, 89°F July 22, 1952; minimum, 1,130 ppm Mar. 2, 1954; minimum daily, 0 ppm many days.

Sediment loads (1951-57): Maximum daily, 128,000 tons Mar. 2, 1954; minimum daily, 0 tons many days.

REMARKS.--Records of specific conductance and pH of daily samples available in district office at Philadelphia, Pa. Records of discharge for water year October 1956 to September 1957 given in WSP1502.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |
|--------------------|----------------------|----------------------------|-----------|--------------|----------------|-------------|---------------|---------------------------------|----------------------------|---------------|--------------|----------------------------|----------------------------------------------------|-------------------------------|---------------|-------------------------------------------|-----|-------|
|                    |                      |                            |           |              |                |             |               |                                 |                            |               |              |                            |                                                    | Calcium, magnesium            | Non-carbonate |                                           |     |       |

SUSQUEHANNA RIVER BASIN--Continued  
JUNIATA RIVER AT NEWPORT. PA.--Continued

Particle-size analyses of suspended sediment, water year October 1956 to September 1957

(Methods of analysis: B, bottom withdrawal tube; D, decantation; P, pipet; S, sieve; N, in native water;  
W, in distilled water; C, chemically dispersed; M, mechanically dispersed)

| Date of collection | Time        | Discharge (cfs) | Water temperature (°F) | Suspended sediment            |                                            |                                                   |       |       |       |       |       |       |       | Methods of analysis |       |

## SUSQUEHANNA RIVER BASIN--Continued

## BIXLER RUN NEAR LOYSVILLE, PA.

LOCATION.--At bridge on State Highway 850; 400 feet downstream from gaging station, 2.3 miles upstream from mouth, and 3.6 miles west of Loysville, Perry County.

DRAINAGE AREA.--15.0 square miles.

RECORDS AVAILABLE.--Water temperatures: November 1956 to September 1957.

Sediment records: February 1954 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 85°F July 27; minimum, 35°F Nov. 23 and Jan. 2, 3.

Sediment concentrations: Maximum daily, estimated, 580 ppm Nov. 1; minimum daily, 0 ppm Oct. 29, 30.

Sediment loads: Maximum daily, estimated, 650 tons, Nov. 1; minimum daily, 0 tons Oct. 29, 30.

EXTREMES, 1954-57.--Sediment concentrations: Maximum daily, 986 ppm June 10, 1954; minimum daily, 0 ppm, Oct. 29, 30, 1956.

Sediment loads: Maximum daily, estimated, 650 tons Nov. 1, 1956; minimum daily, 0 tons, Oct. 29, 30, 1956.

REMARKS.--Records of specific conductance and pH of periodic sediment samples available in district office at Philadelphia, Pa. Records of discharge for period October 1956 to September 1957 given in WSP 1502.

## Chemical analysis, in parts per million, Jan. 3, 1957

|                                 |     |                                          |     |
|---------------------------------|-----|------------------------------------------|-----|
| Silica (SiO <sub>2</sub> )      | 6.9 | Nitrate (NO <sub>3</sub> )               | 7.1 |
| Iron (Fe)                       | .02 | Dissolved solids (residue at 180°C)      | 102 |
| Manganese (Mn)                  | .00 | Hardness as CaCO <sub>3</sub>            |     |
| Calcium (Ca)                    | 29  | Calcium, magnesium                       | 86  |
| Magnesium (Mg)                  | 3.4 | Noncarbonate                             | 12  |
| Sodium (Na)                     | 1.1 |                                          |     |
| Potassium (K)                   | 1.1 | Specific conductance (micromhos at 25°C) | 188 |
| Bicarbonate (HCO <sub>3</sub> ) | 90  | pH                                       | 8.1 |
| Sulfate (SO <sub>4</sub> )      | 12  | Color                                    | 2   |
| Chloride (Cl)                   | 1.6 |                                          |     |
| Fluoride (F)                    | .0  |                                          |     |

## Temperature (°F) of water, November 1956 to September, 1957

Total discharge for year (cfs-days) ..... 7,408.4

Total load for year (tons) ..... 1,489.8

s Computed by subdividing day.

t Less than 0.05 ton.

a Computed from partly estimated concentration graph.

## SUSQUEHANNA RIVER BASIN--Continued

## BIXLER RUN NEAR LOYSVILLE, PA.--Continued

Particle-size analyses of suspended sediment, water year October 1956 to September 1957

(Methods of analysis: B, bottom withdrawal tube; D, decantation; P, pipet; S, sieve; N, in native water;

W, in distilled water; C, chemically dispersed; M, mechanically dispersed)

## SUSQUEHANNA RIVER BASIN

159

SUSQUEHANNA RIVER BASIN--Continued  
SUSQUEHANNA RIVER AT HARRISBURG, PA.

LOCATION.--At gaging station at Walnut Street Bridge in Harrisburg, Dauphin County.

DRAINAGE AREA.--24,100 square miles.

RECORDS AVAILABLE.--Chemical analyses: Composites of daily samples collected from east channel station 1180, October 1944 to September 1946. Cross-section samples, one to three times monthly, October 1944 to September 1949. Monthly cross-section samples November 1950 to January 1953, March 1956 to September 1957.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

## Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Station      | Mean discharge (cfs) | Bicar-bonate (HCO <sub>3</sub> ) | Sul-fate (SO <sub>4</sub> ) | Chlo-ride (Cl) | Ni-trate (NO <sub>3</sub> ) | Hardness as CaCO <sub>3</sub> |                | Specific conduct-ance (micro-mhos at 25° C) | pH   | Color |
|--------------------|--------------|----------------------|----------------------------------|-----------------------------|----------------|-----------------------------|-------------------------------|----------------|---------------------------------------------|------|-------|
|                    |              |                      |                                  |                             |                |                             | Calcium, mag-nesium           | Non-carbon-ate |                                             |      |       |

## POTOMAC RIVER BASIN

CRABTREE CREEK NEAR SWANTON, MD.

LOCATION --Temperature recorder at gaging station, 0.9 mile upstream from Middle Fork, 1.0 mile downstream from Springlick Run, and 5.0 miles northeast of Swanton, Garrett County.

DRAINAGE AREA --16.7 square miles

RECORDS AVAILABLE --Water temperatures: February 1952 to December 1955, July 1956 to September 1957.

EXTREMES, 1952-1957 --Water temperatures: Maximum recorded, 75°F July 20-22, Aug. 1, 3; minimum freezing point, January 18-21.

EXTREMES, 1952-1957 --Water temperatures: Maximum recorded, 82°F Aug. 2, 3, 1955; minimum, freezing point on many days during winter months.

REMARKS --Records fair, probably because of friction in recorder. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Temperature(°F) of water, water year October 1956 to September 1957.

/Recorder with temperature attachment, continuous ethyl alcohol-actuated thermograph.7

## POTOMAC RIVER BASIN--Continued

## POTOMAC RIVER AT HANCOCK, MD.

LOCATION.--Temperature recorder at gaging station, 0.2 mile downstream from Little Tonoiloway Creek, half a mile downstream from bridge on U. S. Highway 522 at Hancock, Washington County, and 1.1 miles upstream from Tonoiloway Creek (formerly called Great or Big Tonoiloway Creek).  
DRAINAGE.--4,073 square miles.

RECORDS AVAILABLE.--Water temperatures: July 1952 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 90° F July 22; minimum, freezing point several days during November and December.

EXTREMES, 1952-57.--Water temperatures: Maximum, 93° F July 22, 1952; minimum, freezing point several days during winter months of 1955, 1956 and 1957.

REMARKS.--Records fair, probably because of friction in recorder. Temperature range during missing period Jan. 4-14, 32° F to 39° F. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

Temperature (°F) of water, water year October 1956 to September 1957

## RAPPAHANNOCK RIVER BASIN

## RAPPAHANNOCK RIVER AT REMINGTON, VA.

LOCATION.--At gaging station at bridge on U. S. Highway 29 at Remington, Fauquier County, 0.3 mile upstream from Tinpot Run, 0.4 mile downstream from Ruffans Run, 2.5 miles downstream from Hazel River, and at mile 35.2.

DRAINAGE AREA.--616 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1951 to September 1956.

Water temperatures: May 1951 to September 1956.

Sediment records: April 1951 to September 1957.

EXTREMES, 1956-57.--Sediment concentrations: Maximum daily, 400 ppm Apr. 5; minimum daily, 2 ppm on several days.

Sediment loads: Maximum daily, 4,830 tons Apr. 5; minimum daily, less than 0.50 ton on several days.

EXTREMES, 1951-57.--Sediment concentrations: Maximum daily, 1,240 ppm June 10, 1951; minimum daily, 1 ppm on many days.

Sediment loads: Maximum daily, 23,400 tons June 10, 1951; minimum daily, less than 0.50 ton on many days.

REMARKS.--Records of specific conductance of daily samples available in district office at Raleigh, N. C. Records of discharge for water year October 1956 to September 1957 given in WSP 1502.

## CHOWAN RIVER BASIN

## CHOWAN RIVER AT WINTON, N. C.

LOCATION --At drawbridge on U. S. Highway 158 and State Highway 97 at Winton, Hertford County, and 2.7 miles downstream from Meherrin River.

DRAINAGE AREA --4 198 square miles.

RECORDS AVAILABLE --Chemical analyses: October 1954 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES 1956-57 --Dissolved solids: Maximum, 126 ppm Sept. 11-20; minimum, 46 ppm Feb. 1-28.

Hardness: Maximum, 29 ppm Sept. 11-20; minimum, 14 ppm Feb. 1-28.

Specific conductance: Maximum daily, 204 micromhos Sept. 20; minimum daily, 43.2 micromhos Feb. 8, 9.

Water temperatures: Maximum, 87° F July 27; minimum, 38° F on several days during January.

EXTREMES 1954-57 --Dissolved solids: Maximum, 150 ppm Dec. 21-31, 1954; minimum, 46 ppm Feb. 1-28, 1957.

Hardness: Maximum, 29 ppm Sept. 11-20, 1957; minimum, 14 ppm Feb. 1-28, 1957.

Specific conductance: Maximum daily, 240 micromhos Feb. 1, 2, 1955; minimum daily, 43.2 micromhos Feb. 8, 9, 1957.

Water temperatures: Maximum, 87° F Aug. 5, 7, 8, 1955, July 27, 1957; minimum, 37° F Feb. 13, 1955, Jan. 1, 1956.

REMARKS --Records of suspended matter of composite samples from October 1954 to September 1955 and records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection         | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |                     | Specific conductance (micro-mhos at 25°C) | pH  | Color |

a Mean daily discharge.

b Calculated from determined constituents.

## ROANOKE RIVER BASIN

## ROANOKE RIVER AT RANDOLPH, VA.

LOCATION.--At bridge on State Highway 746 (old 26), 2.8 miles northwest of Randolph, Charlotte County, 3.6 miles upstream from Roanoke Creek and at mile 227.3

DRAINAGE AREA.--3,000 square miles (approximately).

RECORDS AVAILABLE.--Chemical analyses: April 1929 to March 1930, October 1950 to September 1956.

Water temperatures: October 1950 to September 1956.

Sediment records: January 1954 to September 1957.

EXTREMES, 1956-57.--Sediment concentrations: Maximum daily, 2,060 ppm May 20; minimum daily, 10 ppm Jan. 15-18.

Sediment loads: Maximum daily, 59,900 tons Sept. 18; minimum daily, 26 tons Oct. 10.

EXTREMES, 1954-57.--Sediment concentrations: Maximum daily, 2,060 ppm May 20, 1957; minimum daily, 6 ppm Dec. 28-31, 1955.

Sediment loads: Maximum daily, 71,500 tons Mar. 2, 1954; minimum daily, 13 tons Sept. 21, 22, 1956.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Suspended sediment, water year October 1956 to September 1957

## ROANOKE RIVER BASIN--Continued

## DAN RIVER AT PACES, VA.

LOCATION.--At gaging station at highway bridge, 0.5 mile southeast of Paces, Halifax County, 0.5 mile upstream from Big Toby Creek, 2.7 miles upstream from Birch Creek, and at mile 36.0.

DRAINAGE AREA.--2,550 square miles (approximately).

RECORDS AVAILABLE.--Chemical analyses: October 1955 to August 1956.

Water temperatures: January 1954 to September 1956.

Sediment records: January 1954 to September 1957.

EXTREMES, 1956-57.--Sediment concentrations: Maximum daily, 2,260 ppm Sept. 18; minimum daily, 12 ppm Nov. 30, Dec. 1-3.

Sediment loads: Maximum daily, 94,200 tons Sept. 18; minimum daily, 29 tons Jan. 20.

EXTREMES, 1954-57.--Sediment concentrations: Maximum daily, 2,263 ppm July 13, 1955; minimum daily, 10 ppm Jan. 17, 1956.

Sediment loads: Maximum daily, 94,200 tons Sept. 18, 1957; minimum daily 11 tons Sept. 23, 1956.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Suspended sediment, water year October 1956 to September 1957

## ROANOKE RIVER BASIN--Continued

## ROANOKE RIVER AT JAMESVILLE, N. C.

LOCATION --At boat dock in Jamesville, Martin County, and 1 mile downstream from lower mouth of Devils Gut.

DRAINAGE AREA --9,247 square miles.

RECORDS AVAILABLE --Chemical analyses: October 1954 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES 1956-57 --Dissolved solids: Maximum, 85 ppm June 1-31; minimum, 54 ppm June 1-30.

Hardness: Maximum, 44 ppm July 1-31; minimum, 13 ppm June 1-30.

Specific conductance: Maximum daily, 140 micromhos Dec. 13; minimum daily, 71.2 micromhos Feb. 7.

Water temperatures: Maximum, 84°F July 30, Aug. 3, 4; minimum, 39°F Jan. 19.

EXTREMES 1955-57 --Dissolved solids: Maximum, 81 ppm June 1-10, 1956; minimum, 54 ppm June 1-30, 1957.

Hardness: Maximum, 45 ppm Sept. 21-30, 1956; minimum, 13 ppm June 1-30, 1957.

Specific conductance: Maximum daily, 153 micromhos June 23, 1956; minimum daily, 71.2 micromhos Feb. 7, 1957.

Water temperatures: Maximum, 88°F July 6, 1956; minimum, 37°F Jan. 9, 1956.

REMARKS --Records of suspended matter of composite samples from October 1955 to September 1956 and records of specific conductance of daily samples from October 1955 to September 1957 available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection    | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

b Mean daily discharge.

## PAMLICO RIVER BASIN

## FISHING CREEK NEAR ENFIELD, N. C.

LOCATION.--Temperature recorder at gaging station on right bank 15 feet downstream from bridge on U. S. Highway 301, 2,000 feet downstream from Atlantic Coast Line Railroad bridge, 2 miles southwest of Enfield, Halifax County, and  $\frac{3}{4}$  miles downstream from Rocky Creek, and at mile 27.7.

DRAINAGE AREA.--521 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1948 to September 1949.

Water temperatures: October 1948 to September 1949, October 1953 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 84°F Aug. 12; minimum, 34°F Jan. 20-22.

EXTREMES, 1948-49, 1953-57.--Water temperatures: Maximum, 86°F July 27-29, 1955; minimum, 33°F Dec. 28, 1948.

REMARKS.--No records July 3-19, 23, 28-31, Aug. 1-6 due to thermometer out of water. Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Temperature (°F) of water, water year October 1956 to September 1957

## PAMLICO RIVER BASIN--Continued

TAR RIVER NEAR PACTOLUS, N. C.

LOCATION.--At Yankee Hall Landing about 1.5 miles southeast of Pactolus, Pitt County.

DRAINAGE AREA.--2 680 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 82 ppm July 21-31; minimum, 53 ppm Mar. 1-10.

Hardness: Maximum, 30 ppm July 11-20, 21-31; minimum, 13 ppm Dec. 21-31.

Specific conductance: Maximum daily, 131 micromhos Aug. 23; minimum daily, 47.2 micromhos Mar. 8.

Water temperatures: Maximum, 90°F Aug. 3, 7; minimum, 39°F Jan. 18.

REMARKS.--Records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection  | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## PAMLICO RIVER BASIN--Continued

## TAR RIVER AT GRIMESLAND, N. C.

LOCATION--At bridge on county road, 1 mile northeast of Grimesland, Pitt County, 0.3 mile upstream from Chicod Creek, and 1.8 miles upstream from Grindie Creek.

DRAINAGE AREA--2,740 square miles.

RECORDS AVAILABLE--Chemical analyses: September 1954 to September 1957.

WATER TEMPERATURES--October 1954 to September 1956.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 117 ppm Sept. 27-28; minimum, 57 ppm Mar. 11-20.

Hardness: Maximum, 33 ppm Sept. 27-28; minimum, 14 ppm Dec. 21-31, Feb. 11-19.

Specific conductance: Maximum daily, 234 micromhos Sept. 28; minimum daily, 46.9 micromhos Feb. 10-11.

EXTREMES, 1954-57.--Dissolved solids: Maximum, 10,500 ppm Oct. 15 (p.m.), 1954; minimum, 52 ppm Feb. 12-20, 1956.

Hardness: Maximum, 1,940 ppm Oct. 15 (p.m.), 1955; minimum, 13 ppm July 21, 1955.

Specific conductance: Maximum daily, 15,600 micromhos Oct. 15 (p.m.), 1954; minimum daily, 46.9 micromhos Feb. 10-11, 1957.

REMARKS.--Records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

## Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |
|--------------------|----------------------|----------------------------|-----------|--------------|----------------|-------------|---------------|---------------------------------|----------------------------|---------------|--------------|----------------------------|----------------------------------------------------|-------------------------------|---------------|-------------------------------------------|-----|-------|

a Mean daily discharge.

b Calculated from determined constituents.

NEUSE RIVER BASIN  
NEUSE RIVER NEAR RALEIGH, N. C.

LOCATION.--At bridge on U. S. Highway 64, 6.1 miles east of Raleigh, Wake County.

DRAINAGE AREA.--876 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES: 1956-57.--Dissolved solids: Maximum, 205 ppm July 4-7; minimum, 37 ppm Aug. 27-28.

Hardness: Maximum, 34 ppm July 4-7; minimum, 13 ppm Feb. 1-10, Aug. 19.

Specific conductance: Maximum daily, 388 micromhos July 23; minimum daily, 46.6 micromhos Feb. 2.

Water temperatures: Maximum, 78°F July 12; minimum, 34°F Jan. 21.

REMARKS.--Records of suspended matter of composite samples and records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

## NEUSE RIVER BASIN--Continued

## NEUSE RIVER NEAR SELMA, N. C.

LOCATION.--At bridge on county road, 2.1 miles northwest of Selma, Johnston County, and 9.9 miles downstream from gaging station near Clayton.

DRAINAGE AREA.--1,175 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1955 to September 1957.

Water temperatures: October 1955 to September 1957.

EXTREMES 1956-57.--Dissolved solids: Maximum, 151 ppm Aug. 1-18; minimum, 56 ppm Feb. 1-28.

Hardness: Maximum, 31 ppm Aug. 1-18; minimum, 19 ppm Feb. 1-28; War. 1-31.

Specific conductance: Maximum daily, 270 micromhos Aug. 17; minimum daily, 44.3 micromhos May 13.

Water temperatures: Maximum, 90°F Aug. 16; minimum, 38°F Jan. 3-5, 18, 19, 1957.

EXTREMES 1955-57.--Dissolved solids: Maximum, 151 ppm Aug. 1-18, 1957; minimum, 35 ppm Mar. 17-20, 1956.

Hardness: Maximum, 31 ppm Aug. 1-18, 1957; minimum, 14 ppm Mar. 17-20, 1956.

Specific conductance: Maximum daily, 270 micromhos Aug. 17, 1957; minimum daily, 44.3 micromhos May 13, 1957.

Water temperatures: Maximum, 90°F Aug. 16, 1957; minimum, 33°F Dec. 16, 1955.

REMARKS.--During period October 1955 to March 1956, samples collected 9.9 miles upstream at bridge on State Highway 42, 3 miles east of Clayton, N. C.

Records of suspended matter of composite samples from October 1955 to September 1956 and records of specific conductance of daily samples available in district office at Raleigh, N. C. Records of discharge for gaging station near Clayton for water year October 1956 to September 1957 given in WSP 1503.

No appreciable inflow between gaging station and sampling point except during periods of heavy local runoff.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection         | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

# NEUSE RIVER BASIN--Continued

NEUSE RIVER NEAR FORT BARNWELL, N. C.

LOCATION.--At county bridge off State Highway 55 between Fort Barnwell and Vanceboro, Craven County.

DRAINAGE AREA.--3,897 square miles.

RECORDS AVAILABLE.--Chemical analyses: September 1954 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 81 ppm Aug. 11-20; minimum, 50 ppm Mar. 11-20.

Hardness: Maximum, 29 ppm Aug. 11-20; minimum, 13 ppm Dec. 21-31, Feb. 1-10, 11-19, Mar. 1-10.

Specific conductance: Maximum daily, 169 micromhos Aug. 17; minimum daily, 56.8 micromhos Feb. 9, 10.

Water temperatures: Maximum, 88°F Aug. 1-3; minimum, 41°F Jan. 16-18.

EXTREMES, 1954-57.--Dissolved solids: Maximum, 186 ppm Sept. 26-27, 1954; minimum, 50 ppm Mar. 11-20, 1957.

Hardness: Maximum, 171 ppm Oct. 12, 15, 1954; minimum, 12 ppm Mar. 21-31, 1956.

Specific conductance: Maximum daily, 673 micromhos Aug. 21, 1955; minimum daily, 49.1 micromhos Mar. 27, 1956.

Water temperatures: Maximum, 91°F Aug. 12-13, 1956; minimum, freezing point Jan. 13, 1955.

REMARKS.--Records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## NEUSE RIVER BASIN

## NEUSE RIVER NEAR (COWEN LANDING) VANCEBORO, N. C.

LOCATION.--At Cowen Landing about 6 miles southeast of Vanceboro, Craven County.

DRAINAGE AREA.--4,027 square miles.

RECORDS AVAILABLE.--Chemical analyses: September 1954 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 400 ppm Oct. 17; minimum, 54 ppm Mar. 21-31.

Hardness: Maximum, 78 ppm Oct. 17; minimum, 13 ppm Feb. 11-19.

Specific conductance: Maximum daily, 1,400 micromhos Sept. 30; minimum daily, 58.7 micromhos June 16 (p.m.).

Water temperatures: Maximum, 89°F July 9, 14, 16, 22, Aug. 4 (p.m.); minimum, 40°F Jan. 18, 20, 21 (a.m.).

EXTREMES, 1954-57.--Dissolved solids: Maximum, 6,270 ppm Oct. 15 (p.m.); minimum, 54 ppm Mar. 21-31, 1956, Mar. 21-31, 1957.

Hardness: Maximum, 1,550 ppm Aug. 12 (p.m.), 1955; minimum, 12 ppm July 16 (p.m.), 17-20, 1955.

Specific conductance: Maximum daily, 12,900 micromhos Aug. 12 (p.m.), 1955; minimum daily, 41.1 micromhos Sept. 20 (p.m.), 1955.

Water temperatures: Maximum, 92°F July 28 (p.m.), 1955; minimum, 35°F Jan. 21 (a.m.), 1955, Dec. 17 (a.m.), 1955.

REMARKS.--Samples collected twice daily (8:00 a.m. and 6:00 p.m.). Samples collected in morning and afternoon were composited unless otherwise noted. Records of specific conductance of samples collected twice daily available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micromhos at 25°C) | pH  | Color |

NEUSE RIVER BASIN--Continued  
NEUSE RIVER NEAR (STREETS FERRY) VANCEBORO, N. C.

LOCATION.--At Streets Ferry about 1½ miles east of Lima, Craven County.

DRAINAGE AREA.--4,040 square miles.

RECORDS AVAILABLE.--Chemical analyses: September 1954 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 5,060 ppm Oct. 17 (a.m.); minimum, 52 ppm Mar. 1-10, 21-31.

Hardness: Maximum, 890 ppm Oct. 17 (a.m.); minimum, 13 ppm Feb. 11-19, Mar. 11-20.

Specific conductance: Maximum daily, 12,100 micromhos Sept. 29 (m.), Sept. 30 (a.m.); minimum daily, 56.4 micromhos Mar. 12 (m.).

Water temperatures: Maximum, 87°F July 14; minimum, 40°F Jan. 19, 20.

EXTREMES, 1954-57.--Dissolved solids: Maximum, 12,100 ppm Oct. 15 (m.), 1954; minimum, 50 ppm Apr. 21-30, 1956.

Hardness: Maximum, 2,220 ppm Oct. 15 (m.), 1954; minimum, 13 ppm Feb. 11-19, Mar. 11-20, 1957.

Specific conductance: Maximum daily, 17,800 micromhos Oct. 15 (m.), 1954; minimum daily, 51.9 micromhos Mar. 27 (a.m.), 1956.

Water temperatures: Maximum, 90°F July 28 (p.m.), 1955; minimum, 39°F Dec. 8 (a.m.), 1954.

REMARKS.--Samples collected three times daily (6 a.m., 12 m., 6 p.m.). Three daily samples were composited unless otherwise noted. Records of specific conductance of samples collected three times daily available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection                 | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

NEUSE RIVER BASIN--Continued  
SWIFT CREEK NEAR VANCEBORO, N. C.

LOCATION.--At gaging station at highway bridge 2½ miles upstream from bridge on State Highway 118, 2½ miles downstream from Clayrot Swamp, and 3½ miles northwest of Vanceboro, Craven County.

DRAINAGE AREA.--182 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1950 to September 1952, January 1955 to September 1957.

Water temperatures: October 1950 to September 1957. Maximum, 298 ppm June 22, 24-30; minimum, 80 ppm Oct. 17-20.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 298 ppm June 22, 24-30; minimum, 80 ppm Oct. 17-20.

Hardness: Maximum, 63 ppm Sept. 1-5; minimum, 24 ppm Mar. 1-10.

Specific conductance: Maximum daily, 618 micromhos July 1; minimum daily, 67.1 micromhos Mar. 12.

Water temperatures: Maximum, 78°F July 10, 11, 15, Aug. 4-6; minimum, 35°F Jan. 19-21.

EXTREMES, 1951-52, 1954-57.--Dissolved solids (1951-52, 1955-57): Maximum, 349 ppm June 11-20, 1955; minimum, 66 ppm Mar. 1-10, 1952.

Hardness: Maximum, 96 ppm Jan. 1-10, 1955; minimum, 15 ppm Sept. 21-30, 1955.

Specific conductance (1955-57): Maximum daily, 865 micromhos June 21, 1955; minimum daily, 29.5 micromhos Sept. 21, 1955.

Water temperatures: Maximum, 87°F July 29, 1952; minimum, 35°F Jan. 19-21, 1957.

REMARKS.--Records of suspended matter of composite samples from October 1951 to September 1952 and records of specific conductance of daily samples from January 1955 to September 1957 available in district office at Raleigh, N. C. Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

NEUSE RIVER BASIN--Continued

NEUSE RIVER AT NEW BERN, N. C.

LOCATION--At bridge on U. S. Highway 17 at New Bern, Craven County.

DRAINAGE AREA--4,467 square miles.

RECORDS AVAILABLE--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Specific conductance: Maximum daily, 25 900 micromhos Sept. 28 (bottom); minimum daily, 64.6 micromhos Mar. 11 (top).

REMARKS.--Integrated samples collected daily during October and November and a top sample and a bottom sample were collected once daily during December through September. Records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

Chloride, in parts per million, water year October 1956 to September 1957

LOCATION.--At gaging station 50 feet downstream from Free Bridge, 800 feet downstream from Little Chinquapin Branch, 1½ miles southwest of Phillips Crossroads and 6 miles west of Trenton, Jones County.

DRAINAGE AREA.--168 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1951 to September 1953, January 1955 to September 1957.

Water temperatures: October 1951 to September 1953, January 1955 to September 1957.

EXTREMES: 1956-57.--Dissolved solids: Maximum 153 ppm Sept. 1-10, minimum, 73 ppm Mar. 11-20.

Hardness: Maximum 117 ppm Aug. 11-20; minimum, 28 ppm Mar. 1-10.

Specific conductance: Maximum daily, 257 micromhos 36°F Jan. 5.

Water temperatures: Maximum 86°F June 17; minimum, 36°F Jan. 10.

EXTREMES: 1951-53.--Dissolved solids: Maximum, 153 ppm Sept. 1-10, 1957; minimum, 59 ppm Mar. 1-10, 1952.

Hardness: Maximum, 117 ppm Aug. 11-20, 1957; minimum, 20 ppm May 5-10, 1956.

Specific conductance (1955-57).--Dissolved solids: Maximum daily, 237 micromhos June 17, 1957; minimum daily, 51.5 micromhos May 10, 1956.

Water temperatures: Maximum, 86°F June 17, 1957; minimum, freezing point Jan. 9, 10, 17, 1956.

REMARKS.--Records of suspended matter of composite samples from October 1951 to September 1953 and records of specific conductance of daily samples from January 1955 to September 1957 available in district office at Raleigh, N. C. Records of discharge for water year October 1956 to September 1957 given in MSP 1503.

Chemical analyses, in parts per million, water year October 1956 to September 1957

## NEUSE RIVER BASIN--Continued

## TRENT RIVER AT POLLOCKSVILLE, N. C.

LOCATION (revised) --At bridge on U. S. Highway 17 in Pollocksville, Jones County, 0.4 mile upstream from Mill Creek.  
DRAINAGE AREA (revised) --372 square miles.

RECORDS AVAILABLE --Chemical analyses: January 1955 to September 1957

Water temperatures: January 1955 to September 1957.

EXTREMES: 1956-57. --Dissolved solids: Maximum, 216 ppm Oct. 3; minimum, 77 ppm Mar. 1-10.

Hardness: Maximum, 100 ppm Oct. 3; minimum, 28 ppm Mar. 1-10.

Specific conductance: Maximum daily, 421 micromhos Oct. 3; minimum daily, 78.6 micromhos Mar. 8.

Water temperatures: Maximum, 82 F on several days during June and July; minimum, 40 F Feb. 5, 11, 13, 18.

EXTREMES: 1955-57. --Dissolved solids: Maximum, 5,080 ppm Jan. 1-8, 1955; minimum, 66 ppm Sept. 21-30, 1955, Mar. 21-31, 1956.

Hardness: Maximum, 1,200 ppm Jan. 19, 1955; minimum, 19 ppm Sept. 21-30, 1955.

Specific conductance: Maximum daily, 9,230 micromhos Jan. 19, 1955; minimum daily, 36.1 micromhos Sept. 22-23, 1955.

Water temperatures: Maximum, 88 F June 7, 1956; minimum, 39 F Dec. 26-28, 30-31, 1955.

REMARKS --Records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

| Date of collection    | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## NEUSE RIVER BASIN--Continued

## TRENT RIVER NEAR RHEMS, N. C.

LOCATION.--At end of county road about 2½ miles southeast of Rhems, Craven County, and about 1 mile downstream from Deep Gully.

DRAINAGE AREA.--425 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Specific conductance: Maximum daily, 13,200 micromhos Sept. 30. minimum daily, 90.3 micromhos Mar. 13.

Water temperatures: Maximum, 84°F July 14-18, Aug. 3-5; minimum, 40°F Jan. 18-20.

REMARKS.--No discharge records available for this station.

Specific conductance (micromhos at 25°C) and chloride, in parts per million, water year October 1956 to September 1957

## CAPE FEAR RIVER BASIN

## HAW RIVER NEAR BENAJA, N. C.

LOCATION.--Temperature recorder at gaging station. 200 feet upstream from site of old High Rock Mill, 500 feet upstream from highway bridge, half a mile upstream from county line, 6 miles downstream from Troublesome Creek, and 6 miles east of Benaja, Rockingham County.

Drainage Area.--168 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1952 to September 1953.

Water temperatures: October 1952 to September 1953, July 14-16 to September 1957.

EXTREMES, 1956-57.--Water temperatures: Maximum, 78° F. July 14-16; minimum, 34° F. Jan. 20-22.

EXTREMES, 1952-57.--Water temperatures: Maximum, 84° F. Aug. 2, 1953; minimum, freezing point on many days during winter months.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Temperature (°F) of water, water year October 1956 to September 1957

## CAPE FEAR RIVER BASIN--Continued

## HAW RIVER AT HAW RIVER, N. C.

LOCATION.--At gaging station at town of Haw River, Alamance County, 650 feet downstream from Southern Railway bridge and 3 miles downstream from Stony Creek.

DRAINAGE AREA.--599 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |
|--------------------|----------------------|----------------------------|-----------|--------------|----------------|-------------|---------------|---------------------------------|----------------------------|---------------|--------------|----------------------------|----------------------------------------------------|-------------------------------|---------------|-------------------------------------------|-----|-------|

a. Calculated from determined constituents.

## CAPE FEAR RIVER BASIN--Continued

## HAW RIVER AT BYNUM, N. C.

LOCATION --At millrace to textile mill, 100 yards downstream from bridge at Bynum, Chatham County, and 5½ miles upstream from gaging station near Pittsboro.

DRAINAGE AREA --1,280 square miles.

RECORDS AVAILABLE --Chemical analyses: October 1955 to September 1957.

Water temperatures: October 1955 to September 1957.

EXTREMES 1956-57 --Dissolved solids: Maximum, 197 ppm Aug. 21-24; minimum, 60 ppm Mar. 1-10.

Hardness: Maximum, 42 ppm Aug. 24; minimum, 14 ppm July 24.

Specific conductance: Maximum daily, 366 micromhos Aug. 21; minimum daily, 57.0 micromhos Feb. 2.

Water temperatures: Maximum 86°F July 15; minimum, 33°F July 18.

EXTREMES, 1955-57 --Dissolved solids: Maximum, 355 ppm Aug. 24-25, 1956; minimum, 50 ppm Mar. 16-20, 1956.

Hardness: Maximum, 45 ppm July 9, 1956; minimum, 14 ppm July 24, 1957.

Specific conductance: Maximum daily, 657 micromhos Aug. 21, 1956; minimum daily, 57.0 micromhos Feb. 2, 1957.

Water temperatures: Maximum, 88°F July 5, 1956; minimum, 33°F Dec. 22, 1955.

REMARKS --Records of suspended matter of composite samples and records of specific conductance of daily samples available in district office at Raleigh, N. C. Records of gaging station near Pittsboro for water year October 1956 to September 1957 given in WSP 1503. No appreciable inflow between gaging station and sampling point except during periods of heavy local runoff.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color | Oxygen consumed |          |

## CAPE FEAR RIVER BASIN--Continued

## NEW HOPE RIVER NEAR NEW HILL, N. C.

LOCATION.--At bridge on county road, 0.2 mile downstream from mouth of Beaver Creek and approximately 4 miles downstream from gaging station near Pittsboro, Chatham County.

DRAINAGE AREA.--338 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1956 to September 1957.

Water temperatures: October 1956 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 138 ppm Aug. 11-18; minimum, 39 ppm June 4-10.

Hardness: Maximum, 45 ppm Aug. 11-18; minimum, 8 ppm July 24.

Specific conductance: Maximum daily, 208 micromhos Aug. 18; minimum daily, 24.9 micromhos July 24.

Water temperatures: Maximum, 79°F July 15, Aug. 13; minimum, 33°F Jan. 20.

REMARKS.--Records of suspended matter of composite samples and records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color | Oxygen consumed |          |

## CAPE FEAR RIVER BASIN--Continued

## DEEP RIVER AT RAMSEUR, N. C.

LOCATION.--At bridge on U. S. Highway 64 at Ramseur, Randolph County, and  $1\frac{1}{2}$  miles downstream from Sandy Creek.

DRAINAGE AREA.--346 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1946 to September 1947, October 1956 to September 1957.

REMARKS.--Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

## CAPE FEAR RIVER BASIN--Continued

## NORTHEAST CAPE FEAR RIVER NEAR CHINQUAPIN, N. C.

LOCATION.--At bridge on State Highway 41, 540 feet upstream from gaging station, 0.4 mile downstream from Muddy Creek and 1½ miles west of Chinquapin, Duplin County.

DRAINAGE AREA.--600 square miles.

RECORDS AVAILABLE.--Chemical analyses: October 1950 to September 1951, October 1956 to September 1957.

Water temperatures: October 1950 to September 1957.

EXTREMES, 1956-57.--Dissolved solids: Maximum, 163 ppm Aug. 11-20; minimum, 25 ppm Feb. 27-28.

Hardness: Maximum, 40 ppm Aug. 1-10; minimum, 13 ppm Feb. 27-28, Mar. 21-31.

Specific conductance: Maximum daily, 267 micromhos Aug. 13, 14; minimum daily, 46.6 micromhos Feb. 28.

Water temperatures: Maximum, 80°F on several days during July, August, and September; minimum, 37°F Jan. 3, 19, 20.

EXTREMES, 1950-51, 1956-57.--Dissolved solids: Maximum, 163 ppm Aug. 11-20, 1957; minimum, 25 ppm Feb. 27-28, 1957.

Hardness: Maximum, 40 ppm Aug. 1-10, 1957; minimum, 13 ppm Feb. 27-28, Mar. 21-31, 1957.

Specific conductance (1956-57): Maximum daily, 267 micromhos Aug. 13, 14, 1957; minimum daily, 46.6 micromhos Feb. 28, 1957.

Water temperatures: Maximum, 80°F July 1, 1951; minimum, 34°F Dec. 22, 1950.

REMARKS.--Records of suspended matter of composite samples and records of specific conductance of daily samples from October 1956 to September 1957 available in district office at Raleigh, N. C. Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

## Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | pH   | Color | Oxygen consumed |          |
|--------------------|----------------------|----------------------------|-----------|--------------|----------------|-------------|---------------|---------------------------------|----------------------------|---------------|--------------|----------------------------|----------------------------------------------------|-------------------------------|---------------|------|-------|-----------------|----------|
|                    |                      |                            |           |              |                |             |               |                                 |                            |               |              |                            |                                                    | Calcium, magnesium            | Non-carbonate |      |       | Unfiltered      | Filtered |
| Oct. 3-10, 1956    | 280                  | 11                         | 0.21      | 8.1          | 1.3            | 12          | 1.2           | 12                              | 13                         | 18            | 0.1          | 1.7                        | 107                                                | 25                            | 16            | 6.4  | 80    | 18              | 18       |

## CAPE FEAR RIVER BASIN--Continued

## NORTHEAST CAPE FEAR RIVER AT CASTLE HAYNE, N. C.

LOCATION --At bridge on U. S. Highway 117, 0.8 mile north of Castle Hayne, New Hanover County, and 4.7 miles upstream from Prince George Creek. DRAINAGE AREA --1,499 square miles.

RECORDS AVAILABLE --Chemical analyses: October 1954 to September 1957.

Water temperatures: October 1954 to September 1957.

EXTREMES: 1956-57 --Dissolved solids: Maximum 114 ppm Aug. 11, 14-20; minimum, 63 ppm June 11-20.

Hardness: Maximum 33 ppm Aug. 12-13; minimum 17 ppm June 21-30.

Specific conductance: Maximum daily, 187 micromhos Aug. 12; minimum daily, 60.0 micromhos June 25.

Water temperatures: Maximum 48° F Aug. 2; minimum, 45° F Dec. 27-28.

EXTREMES: 1954-57 --Dissolved solids: Maximum 1,530 ppm Oct. 21-22, 26-27, 29, 1954; minimum, 63 ppm June 11-20, 1957.

Hardness: Maximum 516 ppm Oct. 15, 1954; minimum, 10 ppm Sept. 21-30, 1955.

Specific conductance: Maximum daily, 5,060 micromhos Oct. 23, 24, 1954; minimum daily, 34.5 micromhos Sept. 25, 1955.

Water temperatures: Maximum daily, 5,060 micromhos Oct. 23, 24, 1954; minimum, 40° F Dec. 21, 1955.

REMARKS --Values reported for sums are calculated from determined constituents. Records of suspended matter of composite samples and records of specific conductance of daily samples available in district office at Raleigh, N. C. No discharge records available for this station.

## WACCAMAW RIVER BASIN

## WACCAMAW RIVER AT FREELAND, N. C.

LOCATION. --At New Britton Bridge on State Highway 130, 1.0 mile southwest of Freeland, Brunswick County, and 7.0 miles downstream from Juniper Creek. DRAINAGE AREA. --626 square miles.

RECORDS AVAILABLE. --Chemical analyses: October 1950 to September 1951, October 1956 to September 1957.

REMARKS. --Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |

a Organic matter present; sum of mineral constituents 44 parts per million.

b Organic matter present; sum of mineral constituents 40 parts per million.

c Organic matter present; sum of mineral constituents 35 parts per million.

d Organic matter present; sum of mineral constituents 36 parts per million.

e Organic matter present; sum of mineral constituents 31 parts per million.

f Organic matter present; sum of mineral constituents 28 parts per million.

g Organic matter present; sum of mineral constituents 30 parts per million.

h Organic matter present; sum of mineral constituents 30 parts per million.

i Organic matter present; sum of mineral constituents 32 parts per million.

j Organic matter present; sum of mineral constituents 46 parts per million.

k Organic matter present; sum of mineral constituents 48 parts per million.

## PEE DEE RIVER BASIN

## YADKIN RIVER AT YADKIN COLLEGE, N. C.

LOCATION --At gaging station at bridge on U. S. Highway 64, 1½ miles south of Yadkin College, Davidson County, and 6¼ miles downstream from Reedy Creek. DRAINAGE AREA --2,280 square miles.

RECORDS AVAILABLE --Chemical analyses: October 1943 to September 1944, October 1950 to September 1951, October 1955 to September 1957.

Water temperatures: October 1943 to September 1944, October 1950 to September 1951, October 1955 to September 1957.

Sediment records: January 1951 to September 1957.

EXTREMES 1956-57 --Dissolved solids: Maximum, 52 ppm Oct. 1-31; minimum, 36 ppm Feb. 1-28, Apr. 1-30.

Hardness: Maximum, 16 ppm Oct. 1-31, Dec. 1-31, Jan. 1-31, Mar. 1-31, May 1-30, July 1-31, Aug. 1-31; minimum, 11 ppm Apr. 1-30.

Specific conductance: Maximum daily, 88.4 micromhos Oct. 23; minimum daily, 30.0 micromhos Apr. 7.

Water temperatures: Maximum, 84°F July 20; minimum, freezing point Jan. 4.

Sediment concentrations: Maximum daily, 2,550 ppm Sept. 17; minimum daily, 4 ppm Dec. 1-4.

Sediment loads: Maximum daily, 79,700 tons Sept. 17; minimum daily, 12 tons Dec. 1-4.

EXTREMES 1943-44, 1950-51 --Dissolved solids (1943-44, 1950-51, 1955-57): Maximum, 85 ppm Nov. 1-10, 1950; minimum, 32 ppm Mar. 21-31, 1944.

Hardness (1943-44, 1950-51, 1955-57): Maximum, 22 ppm Sept. 1-30, 1956; minimum, 10 ppm July 11-20, 1944.

Specific conductance (1943-44, 1950-51, 1955-57): Maximum, 136 micromhos Aug. 17, 1956; minimum daily, 30.0 micromhos Apr. 7, 1957.

Water temperatures (1943-44, 1950-51, 1955-57): Maximum, 87°F June 18, 1944; minimum, freezing point on many days during winter months.

Sediment concentrations (1943-44, 1950-51, 1955-57): Maximum, 87°F June 18, 1944; minimum daily, 1 ppm Dec. 3, 1953.

Sediment loads (1943-44, 1950-51, 1955-57): Maximum daily, 108,000 tons Jan. 23, 1954; minimum daily, 3 tons Dec. 3, 1953.

REMARKS --Records of suspended matter of composite samples from October 1943 to September 1944, October 1950 to September 1951 and records of specific conductance of daily samples from October 1955 to September 1957 available in district office at Raleigh, N. C. Records of discharge for water year October 1956 to September 1957 given in WSP 1503.

Chemical analyses, in parts per million, water year October 1956 to September 1957

| Date of collection         | Mean discharge (cfs) | Silica (SiO <sub>2</sub> ) | Iron (Fe) | Calcium (Ca) | Magnesium (Mg) | Sodium (Na) | Potassium (K) | Bicarbonate (HCO <sub>3</sub> ) | Sulfate (SO <sub>4</sub> ) | Chloride (Cl) | Fluoride (F) | Nitrate (NO <sub>3</sub> ) | Dissolved solids (residue on evaporation at 180°C) | Hardness as CaCO <sub>3</sub> |               | Specific conductance (micro-mhos at 25°C) | pH  | Color |
